

ISA Friction

Research notes:

Friction is the force resisting the movement of one solid surfaces, fluid layers, or material elements sliding against another surface.

<https://en.wikipedia.org/wiki/Friction>, 2/4/16

Think of surfaces as having bumps and troughs, see figure 1. Even when a surface feels smooth to the touch they still have these features. We cannot see them because they are very small, about the size of a molecule.

Figure 1 <http://www.sp5ll.ch/files/content/sites/default/files/images/rough-surface2.png>, 2/4/16

Imagine a hockey player hitting a puck across a very, very large ice rink. Because ice has a much lower friction with regard to the puck, than does carpet or asphalt, the puck will travel much further. Still, however, the ice has some friction, and, therefore, the puck will come to a stop at some point.

Now suppose that instead of ice, the surface and objects in contact with it were friction-free, zero friction. Then what would happen if the player hit the puck? Imagine that the rink covers the entire surface of the Earth, it would travel and travel and travel, around the planet. It would never stop, because there would be no friction to stop it. So friction can be helpful, if you need to stop.
