Non-Newtonian Flow and Applied Rheology R. P. Chhabra, Swati A. Patel, 2025-03-01 Non-Newtonian Flow and Applied Rheology Engineering Applications Third Edition bridges the gap between the theoretical work of the rheologist and the practical needs of those who have to design and operate the systems in which these materials are handled or processed. This new edition addresses the rapid advances that are occurring in all aspects of the topics covered in this book, such as new measurement techniques or new constitutive equations and more reliable information based on numerical simulations. New solved examples are added in each chapter along with a list of problems at the end of the book. This is an established and important reference for senior-level mechanical engineers, chemical and process engineers, as well as any engineer or scientist who needs to study or work with these fluids, including pharmaceutical engineers, mineral processing engineers, medical researchers, water and civil engineers. Extensively revised and expanded with material on new measurement techniques, new constitutive equations, and information based on numerical simulations. Covers both basic rheology and fluid mechanics in non-Newtonian fluids, making it a truly self-contained reference for anyone studying or working with the processing and handling of fluids. Provides solved examples to illustrate and/or aid understanding of the concepts. Written by a world's leading expert in an accessible style.

Flow-Induced Alignment in Composite Materials T.D. Papathanasiou, Andre Benard, 2021-10-19 The purpose of aligning short fibers in a fiber-reinforced material is to improve the mechanical properties of the resulting composite. Aligning the fibers generally in a preferred direction allows them to contribute as much as possible to reinforcing the material. The first edition of this book detailed in a single volume the science, processing, applications, characterization, and properties of composite materials reinforced with short fibers that have been orientated in a preferred direction by flows arising during processing. The technology of fiber-reinforced composites is continually evolving, and this new edition provides timely and much-needed information about this important class of engineering materials. Each of the original chapters has been brought fully up to date, and new developments such as the advent of nano-composites and the issues relating to their alignment, the wider use of long fiber composites, and the appearance of models able to capture their orientation during flow, the wider use of flows in micro-channels in the context of composites fabrication, and the increase in computing power which has made relevant simulations, especially coupling flow kinematics to fiber content and orientation, much easier to perform, are all covered in detail. The book will be an essential up-to-date reference resource for materials

scientists students and engineers who are working in the relevant areas of particulate composites short fiber reinforced composites or nanocomposites Presents recent progress on flow induced alignment modelling and design of fiber and particulate filled polymer composites Discusses important advances such as alignment of CNTs in polymer nanocomposites and molecular alignment of polymers induced by the injection molding process in the presence of fillers such as short fibers Presents fiber interaction diffusion modelling and also the fiber flexure breakage models

Nonlinear Phenomena in Flows of Viscoelastic Polymer Fluids A.I. Leonov, A.N. Prokunin, 2012-12-06 This monograph presents theoretical and experimental studies of flows of elastic liquids Falling into this category are particularly the melts and concentrated solutions of such flexible chain polymers as polyethylene polyisobutylene and polypropylene all of which are widely used in polymer processing These polydisperse polymers vary greatly from batch to batch in their mechanical properties and 20% variation in a property is believed to be good enough 17 All recent books devoted to the rheology of polymers do not answer the question of which constitutive equations should be used for solving the fluid mechanic problems of polymer processing in the usual case of an appreciable nonlinear region of deformation where nonlinear effects of shear and extensional elasticity are very important Viscoelastic constitutive equations cited commonly see e g Refs 5 and 6 do not describe simultaneously even the simplest cases of deformations viz simple shear and uniaxial extension Moreover some of them are internally inconsistent and sometimes display highly unstable behaviour in simple flows without any fundamental reasons Even more respected molecular approach free from these defects
