The Route to Patient Safety in Robotic Surgery Lorenzo Grespan, Paolo Fiorini, Gianluca Colucci, 2018-12-13 The introduction of a new technology in a consolidated field has the potential to disrupt usual practices and create a fertile ground for errors An example is robotic surgery that is now used in most surgical specialties pushed by technology developers and enthusiastic surgeons To analyze the potential impact of robotic surgery on patient safety a consortium of major European Universities started the project SAFROS whose findings are summarized and further elaborated in the three parts of this book Part one describes safety in complex systems such as surgery how this may disrupt the traditional surgical workflow how safety can be monitored and the research questions that must be posed Part two of the book describes the main findings of this research by identifying the risks of robotic surgery and by describing where its ancillary technologies may fail This part addresses features and evaluation of anatomic imaging and modeling actions in the operating room robot monitoring and control operator interface and surgical training Part three of the book draws the conclusions and offers suggestions on how to limit the risks of medical errors One possible approach is to use automation to monitor and execute parts of an intervention thus suggesting that robotics and artificial intelligence will be major elements of the operating room of the future

3D-Position Tracking and Control for All-Terrain Robots Pierre Lamon, 2008-02-12 Rough terrain robotics is a fast evolving field of research and a lot of effort is deployed towards enabling a greater level of autonomy for outdoor vehicles This book demonstrates how the accuracy of 3D position tracking can be improved by considering rover locomotion in rough terrain as a holistic problem Although the selection of appropriate sensors is crucial to accurately track the rover's position it is not the only aspect to consider Indeed the use of an unadapted locomotion concept severely affects the signal to noise ratio of the sensors which leads to poor motion estimates In this work a mechanical structure allowing smooth motion across obstacles with limited wheel slip is used In particular it enables the use of odometry and inertial sensors to improve the

position estimation in rough terrain A method for computing 3D motion increments based on the wheel encoders and chassis state sensors is developed Because it accounts for the kinematics of the rover this method provides better results than the standard approach To further improve the accuracy of the position tracking and the rover's climbing performance a controller minimizing wheel slip is developed The algorithm runs online and can be adapted to any kind of passive wheeled rover Finally sensor fusion using 3D Odometry inertial sensors and visual motion estimation based on stereovision is presented The experimental results demonstrate how each sensor contributes to increase the accuracy and robustness of the 3D position estimation
