An Introduction to Economic Dynamics Srinivas Raghavendra,Petri T. Piironen,2023-03-31 An Introduction to Economic Dynamics provides a framework for students to appreciate and understand the basic intuition behind economic models and to experiment with those models using simulation techniques in MATLAB This book goes beyond the often limited scope of other texts on economic models which have largely focused on elucidating static equilibrium models Comparative static analysis inhibits students from asking how the equilibrium position is achieved from an initial out of equilibrium

position and limits their understanding of the dynamics that underlie such analysis In this textbook readers are introduced to ten well established macroeconomic models including Keynesian multiplier models Samuelson s multiplier and Solow s growth model and guided through the dynamical systems behind each model Every chapter begins with an overview of the economic problem which the model is designed to help solve followed by an explanation of the mathematics of the model Solutions are provided using simulation and visualisation techniques in MATLAB which are interwoven organically with the analysis and are introduced in a step by step fashion to guide the reader along the way Appendices provide an introduction to MATLAB along with all the necessary codes The book is ideally suited for courses in economic dynamics macroeconomic modelling and computational economics as well as for students of finance mathematics and engineering who are interested in economic models

The Solow Model of Economic Growth Paweł Dykas,Tomasz Tokarski,Rafał Wisła,2022-10-21 In 1956 Solow proposed a neoclassical growth model in opposition or as an alternative to Keynesian growth models The Solow model of economic growth provided foundations for models embedded in the new theory of economic growth known as the theory of endogenous growth such as the renowned growth models developed by Paul M Romer and Robert E Lucas in the 1980s and 90s The augmentations of the Solow model described in this book excepting the Phelps golden rules of capital accumulation and the Mankiw Romer Weil and Nonneman Vanhoudt models were developed by the authors over the last two decades The book identifies six spheres of interest in modern macroeconomic theory the impact of fiscal and monetary policy on growth the effect of different returns to scale on production the influence of mobility of factors of production among different countries on their development the effect of population dynamics on growth the periodicity of investment rates and their influence on growth and the effect of exogenous shocks in the form of an epidemic For each of these issues the authors construct and analyze an appropriate growth model that focuses on the description of the specific macroeconomic problem This book not only continues the neoclassical tradition of thought in economics focused on quantitative economic change but also and to a significant extent discusses alternative approaches to certain questions of economic growth utilizing conclusions that can be drawn from the Solow model It is a useful tool in analyzing contemporary issues related to growth
