Methods of Construction and Innovative Materials Arthur Lyons, 2024-04-01 This new textbook has two main themes. The first is Modern Methods of Construction (MMC) which is the off-site manufacture of a wide spectrum of products ranging from whole buildings to be transported onto site down to smaller units or components for site integration. The second theme describes the innovation and progress towards carbon zero by the major generators of CO₂ in the construction industry, namely cement, steel and masonry. The first section of the book describes and illustrates with photographs the major forms of Modern Methods of Construction. These include fully completed 3D units, panelised systems, pods, sub-assemblies and on-site MMC. The section on Innovative Materials then describes a wide range of construction products which are entering into the built environment sector. Some new entrants are variants on well-established construction materials such as steel and concrete. Materials such as these will remain major construction materials for the foreseeable future, but their composition and manufacturing processes will inevitably have to change. Timber also will remain a major construction material, but sustainable sourcing is key, and its utilisation as cross-lamination timber (CLT) or as modified timber is rapidly developing. As a result, students and practitioners must familiarise themselves with these materials, their composition and various uses. The book goes on to describe variants of other traditional building products such as glass, plastic and insulation, which are undergoing major developments leading towards enhanced environmental sustainability, as well as many emergent materials, some of which are likely to be significant in the future. *Methods of Construction and Innovative Materials* is the only book combining these important elements of the future of the industry in an easy-to-read guide for students and new practitioners. It is essential reading for anyone studying and working in the built environment, be they architects, construction managers, surveyors or engineers. *Fundamental Building Technology* Andrew J. Charlett, Craig Maybery-Thomas, 2013-01-25 *Fundamental Building Technology* introduces the technology, methods and processes fundamental to construction by focussing on what is involved in building a typical low-rise house. Written with the novice in mind, this textbook is the ideal starting point for any construction student, as it fully supports the reader all the way to understanding the functional requirements of each element of the building and how to take these into account through the building process itself. This second edition is expanded to cover even more relevant topics and is supported by more resources for use by the student and lecturer. Now included are: An introduction to the planning process and the building regulations; How to incorporate a sustainable approach in the selection of materials and elsewhere; A companion site with lecturer's answers manual and illustrated lecture notes; 150 labelled diagrams throughout the book and multiple self-study questions in every chapter; A students' section of the companion site with multiple-choice quizzes and 250 full-colour photos linked to chapters of the book. Concise, focussed and the most student-friendly guide to this topic available. *Fundamental Building Technology* is the perfect textbook for those taking construction technology modules at undergraduate or HNC/HND level.
