Radiology for PET/CT Reporting Cristina Nanni, Stefano Fanti, Lucia Zanoni, Rita Golfieri, 2022-04-13 This atlas is intended to enable nuclear medicine practitioners who routinely read PET CT scans to recognize the most common CT abnormalities Reading PET CT scans can sometimes be challenging It is not infrequent in fact to encounter abnormal findings in CT images not related to the neoplastic disease under evaluation that are functionally silent and therefore difficult to interpret for nuclear medicine practitioners Frequently these findings are clinically relevant and should be reported interpreted and compared to previous scans This may also have an impact on patient management since expensive tests like PET CT are expected to provide the highest level of diagnostic information Generally CT images associated with a PET scan are acquired in a low dose modality and therefore prove to be sub optimal for CT image interpretation Sometimes a comparison with a full resolution and contrast enhanced CT atlas may be difficult Low dose CT slices are thicker than diagnostic CT and offer less anatomical detail which can affect accuracy in terms of recognizing both anatomical structures and pathological findings Today it is becoming increasingly common to acquire a standard PET CT by combining the administration of contrast media and a diagnostic CT here too basic CT reporting skills are needed in clinical practice This atlas features a chapter on normal anatomy with and without contrast media that is based on low dose and full dose CT images from PET CT standard acquisition and which identifies all the relevant anatomical structures Other chapters focusing on the thorax abdomen pelvis and musculoskeletal system present cases with common and uncommon anatomical abnormalities The addition of new cases with ceCT in this revised second edition rounds out the coverage of PET CT

reporting Given its scope the book will be of interest to nuclear medicine physicians radiologists and oncologists alike
