Haefner, 2012-12-06 This book is intended as a text for a first course on creating and analyzing computer simulation models of biological systems The expected audience for this book are students wishing to use dynamic models to interpret real data much as they would use standard statistical techniques It is meant to provide both the essential principles as well as the details and equations applicable to a few particular systems and subdisciplines Biological systems however encompass a vast diverse array of topics and problems This book discusses only a select number of these that I have found to be useful and interesting to biologists just beginning their appreciation of computer simulation The examples chosen span classical mathematical models of well studied systems to state of the art topics such as cellular automata and artificial life I have stressed the relationship between the models and the biology over mathematical analysis in order to give the reader a sense that mathematical models really are useful to biologists In this light I have sought examples that address fundamental and I think interesting biological questions Almost all of the models are directly compared to quantitative data to provide at least a partial demonstration that some biological models can accurately predict **Proceedings, IEEE Control Systems**

Wolfgang Borutzky, 2009-11-26 Nowadays engineering systems are of ever increasing complexity and must be considered as multidisciplinary systems composed of interacting subsystems or system components from different engineering disciplines Thus an integration of various engineering disciplines e.g. mechanical electrical and control engineering in a current design approach is required With regard to the systematic development and analysis of system models interdisciplinary computer aided methodologies are coming more and more important A graphical description formalism particularly suited for multidisciplinary systems are bond graphs devised by Professor Henry Paynter in as early as 1959 at the Massachusetts Institute of Technology MIT in Cambridge Massachusetts USA and in use since then all over the world This monograph is devoted exclusively to the bond graph methodology It gives a comprehensive in depth state of the art presentation including recent results scattered over research articles and dissertations and research contributions by the author to a number of topics The book systematically covers the fundamentals of developing bond graphs and deriving mathematical models from them the recent developments in methodology symbolic and numerical processing of mathematical models derived from bond graphs Additionally it discusses modern modelling languages the paradigm of object oriented modelling modern software that can be used for building and for processing of bond graph models and provides a chapter with small case studies illustrating various
