Advanced Transport Systems Analysis Modeling And Evaluation Of Performances:

Advanced Transport Systems Milan Janić, 2014-01-11 This book provides a systematic analysis modeling and evaluation of the performance of advanced transport systems. It offers an innovative approach by presenting a multidimensional examination of the performance of advanced transport systems and transport modes useful for both theoretical and practical purposes. Advanced transport systems for the twenty-first century are characterized by the superiority of one or several of their infrastructural, technical, technological, operational, economic, environmental, social, and policy performances as compared to their conventional counterparts. The advanced transport systems considered include Bus Rapid Transit (BRT) and Personal Rapid Transit (PRT) systems in urban areas; electric and fuel cell passenger cars; high-speed tilting trains; High-Speed Rail (HSR); TransRapid; Maglev; TRM; Evacuated Tube Transport system (ETT); advanced commercial subsonic and Supersonic Transport Aircraft (STA) conventionally and Liquid Hydrogen (LH2) fuelled commercial air transportation; advanced Air Traffic Control (ATC) technologies and procedures for increasing the airport runway capacity; Underground Freight Transport (UFT) systems in urban areas; Long Intermodal Freight Trains (LIFTs); road mega-trucks; large advanced container ships and freight cargo aircraft; and advanced freight goods collection/distribution networks. This book is intended for postgraduates, researchers, professionals, and policy makers working in the transport industry.

System Analysis and Modelling in Air Transport Milan Janić, 2021-01-04 This book presents a comprehensive analysis and modelling of demand, capacity, quality of services, economics, and sustainability of the air transport system and its main components: airports, airlines, and ATC/ATM. Airports consist of the airside and landside area, characterized by their capacities for handling demand such as aircraft, air passengers, and air freight cargo shipments. Regarding spatial configuration, airlines generally operate hub and spoke, conventional or legacy airlines, and point-to-point (LCCs) Low-Cost Carriers air route networks. Their fleets, consisting of different aircraft types, provide transport capacity for serving demand, including air passengers and freight cargo shipments. The ATC/ATM includes the controlled airspace, traffic management, and control facilities and equipment on the ground, space, and on-board aircraft, and the ATC Controllers. They all provide capacity to handle demand consisting of the flights between origin and destination airports carried out by airline aircraft. The outcome from the interrelationships between demand and capacity at these components materializes as the quality of services. At airports and airlines, this is generally expressed by congestion and delays of aircraft, air passengers, and freight cargo shipments. At ATC/ATM, this is expressed by delays, horizontal and vertical, in efficiency and safety of flights. Economics of each component relate to its revenues, costs, and profits from handling demand, i.e., providing services of given quality. The sustainability of the air transport system has become an increasingly important issue for many internal and external actors/stakeholders involved to deal with. This has implied increasing the system's overall social/economic effects/benefits while reducing or maintaining constant impacts/costs on the environment and society at both global and regional/local scale under conditions of continuous, medium to long

Transportation Systems Analysis Ennio Cascetta, 2009-08-22 Science is made of facts just as a house is made of bricks but a collection of facts is no more science than a pile of bricks is a house Henri Poincaré The aim of the disciplines of praxis is not theoretical knowledge It is to change the forms of action Aristotle Transportation systems consist not only of the physical and organizational elements that interact with each other to produce transportation opportunities but also of the demand that takes advantage of such opportunities to travel from one place to another This travel demand in turn is the result of interactions among the various economic and social activities located in a given area Mathematical models of transportation systems represent for a real or hypothetical transportation system the demand owns the functioning of the physical and organizational elements the interactions between them and their effects on the external world Mathematical models and the methods involved in their application to real large scale systems are thus fundamental tools for evaluating and or designing actions affecting the physical elements e.g a new railway and or organizational components e.g a new timetable of transportation systems This book discusses the mathematical models that are used to analyze transportation systems presenting them as the result of a limited number of general assumptions theory It also deals with the methods needed to make these models operational and with their application to transportation system project design and evaluation This field of knowledge is known as transportation systems engineering

Marine Research, 1969 Transport Systems Milan Janic, 2017-03-27 The transport sector consists of different modes of transport each serving a growing demand for transporting people and goods This growing demand on the one hand needs expanding the systems capacity and on the other hand increasing the corresponding economic efficiency effectiveness and environmental and social friendliness This implies development of a greener i.e a more sustainable transport sector The book describes the current and prospective state of the art analytical modelling conceptual planning and multi criteria evaluation of the selected cases of transport systems operated by different transport modes such as road rail sea air and intermodal As such the book is unique in addressing these three

important aspects of dealing with transport systems before implementation of their particular components means by the selected cases It will be particularly useful for readers from the academia and the professionals from the transport sector
