Cell Signalling in Prokaryotes and Lower Metazoa I. Fairweather, 2013-11-11 Cell signalling lies at the heart of many biological processes and currently is the focus of intense research interest In multicellular organisms it is central to how different types of cell communicate with each other and how they detect and respond to extracellular signals Intercellular communication is vital to single celled organisms as well

allowing them to respond to environmental cues and signals To date much of the understanding of signalling mechanisms has come from research on specific cell types eg mouse lymphocyte and cardiomyocyte or on organisms in which communication systems such as nervous and endocrine systems are well established This volume therefore aims to fill the gap by concentrating on simple organisms where the elements of those signalling systems first evolved Many of the groups covered contain important pathogens or parasites and the potential for manipulating signalling pathways for therapeutic intervention will be highlighted

Hemoglobin Jay F. Storz, 2019 Provides a synthesis of our current understanding of hemoglobin Hb function and evolution and illustrates how research on this protein has provided more general insights into mechanisms of protein evolution and biochemical adaptation *Membranes to Molecular Machines* Mathias Grote, 2019-07-19 Today s science tells us that our bodies are filled with molecular machinery that orchestrates all sorts of life processes When we think microscopic channels open and close in our brain cell membranes when we run tiny motors spin in our muscle cell membranes and when we see light operates molecular switches in our eyes and nerves A molecular mechanical vision of life has become commonplace in both the halls of philosophy and the offices of drug companies where researchers are developing proton pump inhibitors or medicines similar to Prozac *Membranes to Molecular Machines* explores just how late twentieth century science came to think of our cells and bodies this way This story is told through the lens of membrane research an unwritten history at the crossroads of molecular biology biochemistry physiology and the neurosciences that directly feeds into today s synthetic biology as well as nano and biotechnology Mathias Grote shows how these sciences not only have made us think differently about life they have by reworking what membranes and proteins represent in laboratories allowed us to manipulate life as active matter in new ways Covering the science of biological membranes in the United States and Europe from the mid 1960s to the 1990s this book connects that history to contemporary work with optogenetics a method for stimulating individual neurons using light and will enlighten and provoke anyone interested in the intersection of chemical
