Frames, Fields, and Contrasts Adrienne Lehrer,Eva Feder Kittay,Richard Lehrer,2012-11-12 Recently there has been a surge of interest in the lexicon The demand for a fuller and more adequate understanding of lexical meaning required by developments in computational linguistics artificial intelligence and cognitive science has stimulated a refocused interest in linguistics psychology and philosophy Different disciplines have studied lexical structure from their own vantage points and because scholars have only intermittently communicated across disciplines there has been little recognition that there is a common subject matter The conference on which this volume is based brought together interested thinkers across the

disciplines of linguistics philosophy psychology and computer science to exchange ideas discuss a range of questions and approaches to the topic consider alternative research strategies and methodologies and formulate interdisciplinary hypotheses concerning lexical organization The essay subjects discussed include alternative and complementary conceptions of the structure of the lexicon the nature of semantic relations and of polysemy the relation between meanings concepts and lexical organization critiques of truth semantics and referential theories of meaning computational accounts of lexical information and structure and the advantages of thinking of the lexicon as ordered

Time And Science - Volume 2: Life Sciences Remy Lestienne, Paul Harris, 2023-06-22 Life and Time are very closely linked because life needs the patience of eons to emerge and evolve and also due to the precision timing of neural networks in the perception of the world encoding information and performing actions A dozen renowned biologists and neuroscientists collaborate in this volume to explore the various facets of timing in the living world The temporal programming of the activity of the genetic code controls the essential mechanisms of individual development from zygote to adult while evolution uses the succession of generations to accomplish its work For its part the brain accomplishes the miracle of justifying presentism and reconstructing the continuity of present time from the fragmented data accessible to the senses as well as measuring durations and dating events To this end the brain uses a multilevel temporal coding to transport and decode sensory information and prepare motor responses It is only gradually that we have discovered the temporal precision of the mechanisms involved of the order of a few milliseconds or less for the

adjustment of neural networks or the synaptic plasticity used for memory formation Today the perfection of natural neural networks the energy saving use of spikes of electrical impulses to categorize the sensory environment and to guess its probable future is an example to the modelers and engineers of artificial intelligence

The Big Book of Concepts Gregory Murphy,2004-01-30 Concepts embody our knowledge of the kinds of things there are in the world Tying our past experiences to our present interactions with the environment they enable us to recognize and understand new objects and events Concepts are also relevant to understanding domains such as social situations personality types and even artistic styles Yet like other phenomenologically simple cognitive processes such as walking or understanding speech concept formation and use are maddeningly complex Research since the 1970s and the decline of the classical view of concepts have greatly illuminated the psychology of concepts But persistent theoretical disputes have sometimes obscured this progress The Big Book of Concepts goes beyond those disputes to reveal the advances that have been made focusing on the major empirical discoveries By reviewing and evaluating research on diverse topics such as category learning word meaning conceptual development in infants and children and the basic level of categorization the book develops a much broader range of criteria than is usual for evaluating theories of concepts
