Advances In Quantitative Asset Management Studies In Computational Finance:

Advances in Quantitative Asset Management Christian Dunis, 2000-04-30 *Advances in Quantitative Asset Management* contains selected articles which for the most part were presented at the Forecasting Financial Markets Conference. Although the problem is common and vitally important in the value creation process of almost any corporation, it has not yet been satisfactorily addressed. It is key for any corporation facing strategic resource allocation decisions, be it a pharmaceutical firm valuing and managing its pipeline of drugs, a telecom company having to select a set of technological alternatives, a venture capital or private equity firm investing in a portfolio of ventures or any company allocating resources. Portfolios of real options typically interact such that the value of the whole differs from the sum of the separate parts. Thus one must address and value the particular configuration of options embedded in a specific situation, taking into account the configuration of other options already present in the portfolio, which in turn depends on the correlation structure among the various underlying assets and the strategic dependencies among the options themselves, e.g. mutual exclusivity, strategic additivity, compoundness, complementarity, etc. In that sense

optimal decisions also depend on past option exercise decisions by management and organizational capabilities put in place in the past

Estimation in Conditionally Heteroscedastic Time Series Models Daniel Straumann, 2006-01-27 In his seminal 1982 paper Robert F Engle described a time series model with a time varying volatility Engle showed that this model which he called ARCH autoregressive conditionally heteroscedastic is well suited for the description of economic and financial price Nowadays ARCH has been replaced by more general and more sophisticated models such as GARCH generalized autoregressive heteroscedastic This monograph concentrates on mathematical statistical problems associated with fitting conditionally heteroscedastic time series models to data This includes the classical statistical issues of consistency and limiting distribution of estimators Particular attention is addressed to quasi maximum likelihood estimation and misspecified models along to phenomena due to heavy tailed innovations The used methods are based on techniques applied to the analysis of stochastic recurrence equations Proofs and arguments are given wherever possible in full mathematical rigour Moreover the theory is illustrated by examples and simulation studies
