Our world is changing at an accelerating rate The global human population has grown from 6.1 billion to 7.1 billion in the last 15 years and is projected to reach 11.2 billion by the end of the century The distribution of humans across the globe has also shifted with more than 50 percent of the global population now living in urban areas compared to 29 percent in 1950 Along with these trends increasing energy demands expanding industrial activities and intensification of agricultural activities worldwide have in turn led to changes in emissions that have altered the composition of the atmosphere These changes have led to major challenges for society including deleterious impacts on climate human and ecosystem health Climate change is one of the greatest environmental challenges facing society today Air pollution is a major threat to human health as one out of eight deaths globally is caused by air pollution And future food production and global food security are vulnerable to both global change and air pollution Atmospheric chemistry research is a key part of understanding and responding to these challenges

Atmospheric Environmental Research Detlev Möller, 2012-12-06 This is an extended version of lectures that were held at the summer workshop *Atmosphärische Umweltforschung im Spannungsfeld zwischen Technik und Natur* Atmospheric Environmental Research between Technology and Nature at the Technische Universität Cottbus on July 16, 1996 We were very happy to have Paul J. Crutzen, University of Colorado, Boulder, Colorado, USA, winner of the Nobel Prize for chemistry in 1995 presenting the key lecture on globally changing chemistry in the atmosphere Over the last decades atmospheric chemistry has been established step by step not just as an applied discipline of chemistry but also as a key discipline for our understanding of air pollution biogeochemical cycling and climatic

processes as well. In fact the new definition of meteorology as the science of physics and chemistry of the atmosphere expresses this development very well. The chemistry of the atmosphere is strongly influenced by anthropogenic emissions even on a global scale. As a result of emissions and chemical reactions the chemical composition of the atmosphere influences the ecosystems directly via deposition of trace substances and indirectly by changing the physical climate. Therefore in this book we combined state of the art lectures describing the physical and chemical status of the atmosphere and selected issues representing the interface between atmosphere technology and nature. Oxidising capacity heterogeneous processes and acidity still remain as key issues in atmospheric chemistry even in regions where efficient air control measures have been adopted resulting in reduction of primary atmospheric pollutants.

Photochemistry of Planetary Atmospheres Yuk Ling Yung, William B. DeMore, 1999. This valuable reference presents detailed studies of eleven planetary atmospheres: four for the giant planets Jupiter, Saturn, Uranus and Neptune; four for the small bodies Io, Titan, Triton and Pluto; and three for the terrestrial planets Mars, Venus and Earth. Also using the database provided by recent space missions supplemented by Earth based observations the authors offer an extensive survey of the principal chemical cycles that control the present composition and past history of planetary atmospheres.
