A. Player, 1970 *Atomic Diffusion in Glasses Studied with Coherent X-Rays* Manuel Ross, 2016-01-13 This thesis provides the first successful study of jump diffusion processes in glasses on the atomic scale utilizing a novel coherent technique This new method called atomic scale X ray Photon Correlation Spectroscopy

or aXPCS has only recently been proven to be able to capture diffusion processes with atomic resolution in crystal systems. With this new toolkit for studying atomic diffusion in amorphous systems, new insight into basic processes in a wide range of technically relevant materials like fast ionic conductors can be obtained.

**Some Experiments Using Atomic Beams** J. S. Martin, 1957

**Ultrafast Dynamics Driven by Intense Light Pulses** Markus Kitzler, Stefanie Gräfe, 2015-07-24

This book documents the recent vivid developments in the research field of ultrashort intense light pulses for probing and controlling ultrafast dynamics. The recent fascinating results in studying and controlling ultrafast dynamics in ever more complicated systems such as bio molecules and structures of meso to macroscopic sizes on ever shorter time scales are presented. The book is written by some of the most eminent experimental and theoretical experts in the field. It covers the new groundbreaking research directions that were opened by the availability of new light sources such as fully controlled intense laser fields with durations down to a single oscillation cycle, short wavelength laser driven attosecond pulses and intense X ray pulses from the upcoming free electron lasers. These light sources allowed the investigation of dynamics in atoms, molecules, clusters, on surfaces and very recently also in nanostructures and solids in new regimes of parameters which in turn led to the identification of completely new dynamics and methods for controlling it. Example topics covered by this book include the study of ultrafast processes in large molecules using attosecond pulses, control of ultrafast electron dynamics in solids with shaped femtosecond laser pulses, light driven ultrafast plasmonic processes on surfaces and in nanostructures as well as research on atomic and molecular systems under intense X ray radiation. This book is equally helpful for people who would like to step into this field, e.g. young researchers for whom it provides a broad introduction as well as for already experienced researchers who may enjoy the exhaustive discussion that covers the research on essentially all currently studied objects and with all available ultrafast pulse sources.

**Continuous Beams of Cold Atoms for Space Applications**, The precision of atomic state measurements should ideally be limited by irreducible fluctuations associated with the number of atoms available, e.g. shot noise or quantum projection noise. In practice, other noise sources can limit the precision achievable. A well known effect is the intermodulation effect or Dick effect which degrades the stability of atomic fountain clocks using pulsed sources. One way to beat this source of instability consists of interrogating the atoms with a microwave signal derived from exceptionally stable local oscillators such as cryogenic oscillators which are

however bulky and not ideally suited to the constraints of space Another way of reaching atomic noise limited instability is to use continuous sources of cold atoms Experimental results obtained both on a fountain standard and on an experimental Cs fountain illustrate the potential of continuous cold atomic beams for improving signal to noise ratio and precision of measurement Current developments towards higher atomic beam flux are also described     The Scattering of a Potassium Atomic Beam by a Crossed Beam of Bromine Molecules Richard William Roberts,1960     Atomic Beams Columbia University.
