Turbulence By Jan Mark:

Turbulence Russell J. Marcuso, 2012 In fluid dynamics turbulence or turbulent flow is a fluid regime characterised by chaotic stochastic property changes This includes low momentum diffusion high momentum convection and rapid variation of pressure and velocity in space and time This book presents current research data in the study of turbulence including topics such as modelling turbulent mixing in the global ocean investigating the influence of atmospheric turbulence in the reliability and performance of free space optical communication systems turbulent scales in engineering local versus non local processes in turbulent flows and cosmic rays and astrophysical turbulence

Numerical Solution of the Equations for Compressible Laminar, Transitional, and Turbulent Boundary Layers and Comparisons with Experimental Data

Julius E. Harris, United States. National Aeronautics and Space Administration, 1971 A numerical method for solving the equations for laminar transitional and turbulent compressible boundary layers for either planar or axisymmetric flows is presented The fully developed turbulent region is treated by replacing the Reynolds stress terms with an eddy viscosity model The mean properties of the transitional boundary layer are calculated by multiplying the eddy viscosity by an intermittency function based on the statistical production and growth of the turbulent spots A specifiable turbulent Prandtl number relates the turbulent flux of heat to the eddy viscosity A three point implicit finite difference scheme is used to solve the system of equations The momentum and energy equations are solved simultaneously without iteration Numerous test cases are compared with experimental data for supersonic and hypersonic flows these cases include flows with both favorable and mildly unfavorable pressure gradient histories mass flux at the wall and traverse curvature
