Meteorology: Data Assimilation Methods L. Bengtsson,M. Ghil,E. Källen,2012-12-06 One of the main reasons we cannot tell what the weather will be tomorrow is that we do not know accurately enough what the weather is today Mathematically speaking numerical weather prediction NWP is an initial value problem for a system of nonlinear partial differential equations in which the necessary initial values are known only incompletely and inaccurately Data at the initial time of a numerical forecast can be supplemented however by observations of the atmosphere over a time interval preceding it New observing systems in particular polar orbiting and geostationary satellites which are providing observations continuously in time make it absolutely necessary to find new and more satisfactory methods of assimilating meteorological observations for the dual purpose of defining atmospheric states and of issuing forecasts from the states thus defined Fundamental progress in this area has been made in recent years and this book attempts to give a review and some suggestions for further improvements in the field of meteorological data assimilation methods The European Centre for Medium Range Weather Forecasts ECMWF every year organises seminars for the benefit of meteorologists and geophysicists of the ECMWF Member states The 1980 Seminar was devoted to data assimilation methods and this book contains selected lectures from that seminar The purpose of the seminar was twofold it was intended to give a basic introduction to the subject as well as an overview of the latest developments in the field *Numerical Weather and Climate Prediction* Thomas Tomkins

Assessment of Intraseasonal to Interannual Climate Prediction and Predictability National Research Council, Division on Earth and Life Studies, Board on Atmospheric Sciences and Climate, Committee on Assessment of Intraseasonal to Interannual Climate Prediction and Predictability, 2010-09-08 More accurate forecasts of climate conditions over time periods of weeks to a few years could help people plan agricultural activities mitigate drought and manage energy resources amongst other activities however current forecast systems have limited ability on these time scales Models for such climate forecasts must take into account complex interactions among the ocean atmosphere and land surface Such processes can be difficult to represent realistically To improve the quality of forecasts this book makes recommendations about the development of the tools used in forecasting and about specific research goals for improving understanding of sources of predictability To improve the accessibility of these forecasts to decision makers and researchers this book also suggests best practices to improve how forecasts are made and disseminated

weather prediction models in a single easy to use reference The book illustrates particular uncertainties in observations and data assimilation as well as the errors associated with numerical integration methods Stochastic methods in parameterization of subgrid processes are also assessed as are uncertainties associated with surface atmosphere exchange orographic flows and processes in the atmospheric boundary layer Through a better understanding of the uncertainties to watch for readers will be able to produce more precise and accurate forecasts This is an essential work for anyone who wants to improve the accuracy of weather and climate forecasting and interested parties developing tools to enhance the quality of such forecasts Provides a comprehensive overview of the state of numerical weather prediction at spatial scales from hundreds of meters to thousands of kilometers Focuses on short term 1 15 day atmospheric predictions with some coverage appropriate for longer term forecasts Includes references to climate prediction models to allow applications of these techniques for climate simulations Data Assimilation and Extremes in a Conceptual Atmospheric Model Guannan Hu,2019 **Information**

Flow in an Atmospheric Model and Data Assimilation Young-noh Yoon,2011 Weather forecasting consists of two processes model integration and analysis data assimilation During the model integration the state estimate produced by the analysis evolves to the next cycle time according to the atmospheric model to become the background estimate The analysis then produces a new state estimate by combining the background state estimate with new observations and the cycle repeats In an ensemble Kalman filter the probability distribution of the state estimate is represented by an ensemble of sample states and the covariance matrix is calculated using the ensemble of sample states We perform numerical experiments on toy atmospheric models introduced by Lorenz in 2005 to study the information flow in an atmospheric model in conjunction with ensemble Kalman filtering for data assimilation This dissertation consists of two parts The first part of this dissertation is about the propagation of information and the use of localization in ensemble Kalman filtering If we can perform data assimilation locally by considering the observations and the state variables only near each grid point then we can reduce the number of ensemble members necessary to cover the probability distribution of the state estimate reducing the computational cost for the data assimilation and the model integration Several localized versions of the ensemble Kalman filter have been proposed Although tests applying such schemes have proven them to be extremely promising a full basic understanding of the rationale and limitations of localization is currently lacking We address these issues and elucidate the role played by chaotic wave dynamics in the propagation of information and the resulting impact on forecasts The second part of this dissertation is about ensemble regional data assimilation using joint states Assuming that we have a global model and a regional model of higher accuracy defined in a subregion inside the global region we propose a data assimilation scheme that produces the analyses for the global and the regional model simultaneously considering forecast information from both models We show that our new data assimilation scheme produces better results both in the subregion and the global region than the data assimilation scheme that produces the analyses for the global and the regional model separately
