Advanced Computer Architectures Sajjan G. Shiva, 2018-10-24 Despite the tremendous advances in performance enabled by modern architectures there are always new applications and demands arising that require ever increasing capabilities. Keeping up with these demands requires a deep seated understanding of contemporary architectures in concert with a fundamental understanding of basic principles that allows one to anticipate what will be possible over the system's lifetime. *Advanced Computer Architectures* focuses on the design of high performance supercomputers with balanced coverage of the hardware software structures and application characteristics. This book is a timeless distillation of underlying principles punctuated by real world implementations in popular current and past commercially available systems. It briefly reviews the basics of uniprocessor architecture before outlining the most popular processing paradigms performance evaluation and cost factor considerations. This builds to a discussion of pipeline design and vector processors data parallel architectures and multiprocessor systems. Rounding out the book the final chapter explores some important current and emerging trends such as Dataflow Grid biology inspired and optical computing. More than 220 figures tables and equations illustrate the concepts presented. Based on the author's more than thirty years of teaching and research *Advanced Computer Architectures* endows you with the tools necessary to reach the limits of existing technology and ultimately to break them. *Advanced Computer Architectures* Dezső Sima, 2004 [Electronic System-Level HW/SW Co-Design of Heterogeneous Multi-Processor Embedded Systems](#) Luigi Pomante, 2022-09-01 Modern electronic systems consist of a fairly heterogeneous set of components. Today a single system can be constituted by a hardware platform frequently composed of a mix of analog and digital components and by several software application layers. The hardware can include several heterogeneous microprocessors e.g. GPP DSP GPU etc dedicated ICs ASICs and or FPGAs memories a set of local connections between the system components and some interfaces between the system and the environment sensors actuators etc. Therefore on the one hand multi processor embedded systems are capable of meeting the demand of processing power and flexibility of complex applications. On the other hand such systems are very complex to design and optimize so that the design methodology plays a major role in determining the success of the products. For these reasons to cope with the increasing system complexity the approaches typically used today are oriented towards co design methodologies working at the higher levels of abstraction. Unfortunately such methodologies are typically customized for the specific application suffer of a lack of generality and still need a considerable effort when real size project are envisioned. Therefore there is still the need for a general methodology able to support the designer during the high level steps of a co design flow enabling an effective design space exploration before tackling the low level steps and thus committing to the final technology. This should prevent costly redesign loops. In such a context the work described in this book composed of two parts aims at providing models methodologies and tools to support each step of the co design flow of embedded systems implemented by exploiting heterogeneous multi processor architectures.
