control by megafauna and fire and alternative states in ecosystems An introductory chapter offers a concise overview of trophic cascades while concluding chapters consider theoretical perspectives and comparative issues Trophic Cascades provides a scientific basis and justification for the idea that large predators and top down forcing must be considered in conservation strategies alongside factors such as habitat preservation and invasive species It is a groundbreaking work for scientists and managers involved with biodiversity conservation and protection *Encyclopedia of Inland Waters*, 2009-01-13 Inland aquatic habitats occur world wide at all scales from marshes swamps and temporary puddles to ponds lakes and inland seas from streams and creeks to rolling rivers Vital for biological diversity ecosystem function and as resources for human life commerce and leisure inland waters are a vital component of life on Earth The Encyclopedia of Inland Waters describes and explains all the basic features of the subject from water chemistry and physics to the biology of aquatic creatures and the complex function and balance of aquatic ecosystems of varying size and complexity Used and abused as an essential resource it is vital that we understand and manage them as much as we appreciate and enjoy them This extraordinary reference brings together the very best research to provide the basic and advanced information necessary for scientists to understand these ecosystems and for water resource managers and consultants to manage and protect them for future generations Encyclopedic reference to Limnology a key core subject in ecology taught as a specialist course in universities Over 240 topic related articles cover the field Gene Likens is a renowned limnologist and conservationist Emeritus Director of the Institute of Ecosystems Research elected member of the American Philosophical Society and recipient of the 2001 National Medal of Science Subject Section Editors and authors include the very best research workers in the field *A Century of Parasitology* John Janovy, Jr., Gerald W. Lafferty,David G. Biron,2015-07-24 Next Generation Sequencing technologies are increasingly revealing that microbial taxa likely to be parasites or symbionts are probably much more prevalent and diverse than previously thought Every well studied free living species has parasites parasites themselves can be parasitized As a rule of thumb there is an estimated 4 parasitic species for any given host and the better a host is studied the more parasites are known to infect it Therefore parasites and other symbionts should represent a very large number of species and may far outnumber those with free living lifestyles Paradoxically free living hosts which form the bulk of our knowledge of biology may be a minority Microbial parasites typically are characterized by their small size short generation time and high rates of reproduction with simple life cycle occurring generally within a single host They are diverse and ubiquitous in the environment comprising viruses prokaryotes and eukaryotes This Frontiers Research Topic sought to provide a broad overview but concise comprehensive well referenced and up to date state of the art for everyone involved with microbial parasites in aquatic microbial ecology The Biology and Ecology of Streams and

Rivers Alan Hildrew, Paul Giller, 2023-06-19 The challenges that the world's running water systems now face have never been more numerous or acute at the same time these complex habitats remain absolutely crucial to human wellbeing and future survival. If rivers can ever be anything like sustainable ecology needs to take its place as an equal among the physical sciences such as hydrology and geomorphology. A real understanding of the natural history and ecology of running waters must now be brought even more prominently into river management. The primary purpose of this textbook is to provide the up-to-date overview that students and practitioners will require to achieve this aim. The book's unifying focus is on rivers and streams as ecosystems in which the particular identity of organisms is not the main emphasis but rather the processes in which they are involved specifically energy flow and the cycling of materials. It builds on the physicochemical foundations of the habitat template and explores the diversity and adaptations of the biota progressing from the population and community ecology of organisms and linking them to ecosystem processes and services in the wider biosphere via the complexities of species interactions and food webs. These include water quality and patterns of river discharge as well as aesthetics, waste disposal and environmental health. While the book is not primarily focused on application per se each chapter addresses how humans affect rivers and in turn are affected by them. A final future-oriented chapter identifies key strategic areas and sets a roadmap for integrating knowledge of natural history and ecology into policy and management. The Biology and Ecology of Streams and Rivers is an accessible text suitable for both senior undergraduate and graduate students taking courses in both lotic and general ecology as well as more established researchers, practitioners, managers and conservationists requiring a concise and contemporary overview of running waters.

The Ecosystem Approach to Marine Planning and Management Sue Kidd, Andy Plater, Chris Frid, 2012-08-06 The marine environment is one of our most precious yet fragile natural resources. It provides a wide range of essential goods and services including food, regulation of climate and nutrient cycling as well as a setting for transport, recreation and tourism. This environment is however extremely complex and very sensitive to development pressures and other forms of human influence. Planning and management of the sea are similarly complicated reflecting intricate legal, institutional and ownerships patterns. This creates a situation where marine ecosystems are vulnerable to over-exploitation or neglect. The Ecosystem Approach to Marine Planning and Management describes how growing concern about the state of our seas is resulting in the development of new approaches to marine planning and management. For example the United Nations Environment Programme has called for the widespread introduction of Marine Spatial Planning (MSP) and the European Union has recently been consulting on a new European Maritime Policy designed to stimulate economic growth but at the same time protect the resource base. Within the United Kingdom the 2010 Marine Act draws upon the experience of town and country planning and brings into being a new system of Marine Spatial Planning. The authors show that a common feature of all these developments is an appreciation that more integrated forms of planning and management are required for our seas and that new arrangements must draw together understanding from natural science.
