Table 10 presents regression estimates. As expected, both the price and quantity variables are significant in the case of the quantity being sold. The estimated price elasticity coefficient of each apartment was positive and significant at the 1% level. Interestingly, however, the price elasticity coefficient of the apartment was negative and significant at the 1% level in the case of the price received. This is likely due to the fact that the apartment was sold at a discount to the asking price. The estimated price elasticity coefficient of the apartment was positive and significant at the 1% level in the case of the price received.
