Advanced Separation Techniques For Polyolefins Springer Laboratory:

Advanced Separation Techniques for Polyolefins Harald Pasch, Muhammad Imran Malik, 2014-08-27 This Springer Laboratory volume introduces the reader to advanced techniques for the separation and fractionation of polyolefins. It includes detailed information on experimental protocols and procedures addressing the experimental background of different polyolefin fractionation techniques in great detail. The book summarizes important applications in all major fractionation methods with emphasis on multidimensional analytical approaches. It comprises the most powerful modern techniques such as high temperature size exclusion chromatography HT SEC for molar mass analysis, temperature rising elution fractionation TREF and crystallization analysis fractionation CRYSTAF for the analysis of chemical composition and branching, high temperature two dimensional liquid chromatography HT 2D LC solvent and temperature gradient interaction chromatography SGIC and TGIC and crystallization elution fractionation CEF. Beginners as well as experienced chromatographers will benefit from this concise introduction to a great variety in instrumentation, separation procedures and applications. With detailed descriptions of experimental approaches for the analysis of complex polyolefins, the readers are offered a toolbox to solve simple as well as sophisticated separation tasks. The book starts with an introduction into the molecular complexity of polyolefins, the most widely used synthetic polymers with rapidly growing production capacities. It systematically discusses crystallization based fractionation techniques including TREF, CRYSTAF and CEF and column chromatographic techniques for molar mass, chemical composition and microstructure, as well as the combination of different fractionations in multidimensional experimental setups. This book also includes basic information on the application of high temperature field flow fractionation.

Liquid Chromatography of Synthetic Polymers Muhammad Imran Malik, Dusan Berek, 2023-10-02 This book elucidates the peculiar phenomenon of entropy enthalpy compensation that takes place in high performance liquid chromatography (HPLC) of polymers. Numerous publications, including some books, are devoted to molecular characterization of synthetic polymers, materials presently produced in large and steadily growing quantities applying methods of HPLC. A knowledge of the molecular characteristics of polymers is indispensable not only for their proper applications but also for their recycling and remediation. Polymer scientists generally focus on synthesis and potential applications of polymers while not giving due attention to an important central link: their comprehensive characterization in context of development of structure-property correlations. To fill this gap is one of the aims of the present book. The process of entropy enthalpy compensation plays a decisive role in the advanced method of polymer characterization such as liquid chromatography at critical conditions, eluent gradient interaction chromatography and temperature gradient interaction chromatography. All chemists working on any aspect of polymer science will find this book a valuable resource for the development of structure-property correlations.
