Advanced Topics in Electric Circuits Zdzislaw Trzaska, 2025-06-16 This book is addressed to researchers and practitioners in the theory and applications of electric circuits. It can also serve as a textbook for Ph.D. students examining applications of modern mathematics to important issues emerging nowadays more and more often in advanced electrical and electronic systems. The book offers effective tools to facilitate the study of all those circuits and systems increasingly penetrating our world, helping to discover their hidden beauty. The material is presented in twelve chapters divided into sections. Usually, first sections are of an introductory nature, explain studied phenomena and announce numerical results. More advanced investigations are presented in subsequent sections. The center of concern is set on existing modern methods as well as continuously emerging new methods of investigations useful for researchers, engineers, and practitioners active in many interdisciplinary fields where physics, electrochemistry, and electric circuits play a key role. Coverage includes: Principles of optimal operations of electrical circuits. The equilibrium state of the circuit as a stationary point of its power functional. The Gibbs effect and its consequences for circuit analysis. Accurate calculation of complex dynamic circuits operating in non-sinusoidal periodic states. Energy hysteresis loops in non-sinusoidal periodic states of circuits. Optimal transformations of elements in three-phase circuits. Analog and digital filters. Fractals and their structures and measures. Fibonacci, Sierpinski, and Cantor circuits. Chaos in electrical circuits. Electrochemical impedance spectroscopy. Circuits with nanostructures and their properties. Circuits of fractional orders. AI in electrical circuits. This is the first extensive description of these topics and the interpretations of analytical results and those obtained from computer simulations with MATLAB environments. Special attention is paid to nonlinear electric circuits, and finally, the presentation is extended to effective applications of the achievements of modern AI. Numerous examples and exercises illustrate main results of the book. The book provides readers with a better understanding of origins and properties of many new circuit structures made possible by nanotechnology and atomic microscopy.

Visual Servoing via Advanced Numerical Methods Graziano Chesi, Koichi Hashimoto, 2010-03-15 Robots able to imitate human beings have been at the core of stories of science ctionaswellasdreamsofinventorsforalongtime

Among the various skills that Mother Nature has provided us with and that often go forgotten the ability of sight is certainly one of the most important. Perhaps inspired by tales of Isaac Asimov comics and cartoons and surely helped by the progress of electronics in recent decades researchers have progressively made the dream of creating robots able to move and operate by exploiting artificial vision a concrete reality. Technically speaking we would say that these robots position themselves and their end effectors by using the view provided by some artificial eyes as feedback information. Indeed the artificial eyes are visual sensors such as cameras that have the function to acquire an image of the environment. Such an image describes if and how the robot is moving toward the goal and hence constitutes feedback information. This procedure is known in robotics with the term visual servoing and it is nothing else than an imitation of the intrinsic mechanism that allows human beings to realize daily tasks such as reaching the door of the house or grasping a cup of coffee.

Computational Fluid Dynamics John F. Wendt, 2013-03-09 This book is an outgrowth of a von Kannan Institute Lecture Series by the same title first presented in 1985 and repeated with modifications in succeeding years. The objective then and now was to present the subject of computational fluid dynamics CFD to an audience unfamiliar with all but the most basic aspects of numerical techniques and to do so in such a way that the practical application of CFD would become clear to everyone. Remarks from hundreds of persons who followed this course encouraged the editor and the authors to improve the content and organization year by year and eventually to produce the present volume. The book is divided into two parts. In the first part John Anderson lays out the subject by first describing the governing equations of fluid dynamics concentration on their mathematical properties which contain the keys to the choice of the numerical approach. Methods of discretizing the equations are discussed next and then transformation techniques and grids are also discussed. This section closes with two examples of numerical methods which can be understood easily by all concerned: source and vortex panel methods and the explicit method. The second part of the book is devoted to four self contained chapters on more advanced material. Roger Grundmann treats the boundary layer equations and methods of solution. Gerard Degrez treats implicit time marching methods for inviscid and viscous compressible flows and Eric Dick treats in two separate articles both finite volume and finite element methods.

Army Research and Development, 1968 *Army RD & A.*, 1968 *Learning Electricity and Electronics with Advanced Educational Technology* Michel Caillot, 2013-06-29 The objective of the NATO Advanced Research Workshop Learning electricity and electronics with advanced educational technology was to bring together researchers coming from different domains. Electricity education is a domain where a lot of research has already been made. The first meeting on electricity teaching was organized in 1984 by R Duit, W Jung and C von Rhoneck in Ludwigsburg Germany. Since then research has been going on and we can consider that the workshop was the successor of this first meeting. Our goal was not to organize a workshop grouping only people producing software in the field of electricity education or more generally in the field of physics education even if this software was based on artificial intelligence techniques. On the contrary we wanted this

workshop to bring together researchers involved in the connection between cognitive science and the learning of a well defined domain such as electricity So during the workshop people doing research in physics education cognitive psychology and artificial intelligence had the opportunity to discuss and exchange These proceedings reflect the different points of view The main idea is that designing a learning environment needs the confrontation of different approaches The proceedings are organized in five parts which reflect these different aspects
