

ISTQB Advanced Level Certification – Study Guide (Part 1)

Prior to appearing for exam for ISTQB Advanced Level certification, it is wise to quickly brush up your knowledge by reviewing the following questions – answers that are extremely important from the examination point of view.

Q. 1: What is Configuration management?

Software configuration management encompasses the disciplines and techniques of initiating, evaluating, and controlling change to software products during and after the development process. It emphasizes the importance of configuration control in managing software production.

Configuration management is an integral part of the software development process across all phases of the life cycle. It functions as a controlling discipline, enabling changes to be made to existing documentation and products in such a way as not to destroy the integrity of the software. Since configuration management extends over the life of the product, and since tools, techniques, and standards exist solely aimed at its proper execution, configuration management can stand alone as a module within a graduate curriculum.

Q. 2: What are the Requirements for the Success of Configuration Management?

The key requirement for success of configuration management is the commitment of all levels of management to enforcing its use throughout the project lifetime. Configuration management, like other parts of software engineering perceived as being tedious, may require some coercion for success. A further requirement is the availability of a clearly stated configuration management plan.

Q. 3: How can we say that Configuration Management is a Cost Saving Tool?

By helping to maintain product integrity, configuration management reduces overall software development costs. Cost savings during a particular phase of the life cycle depend on the depth of application of configuration management. For instance, controlling individual source code modules costs more than only controlling the fully integrated product, but should result in overall savings due to reduction in side effects from individual changes. At this time, however, there are no quantitative measures sufficiently well developed to document the cost savings. This is largely because the losses due to lack of configuration management do not occur, and thus cannot be measured.

Q. 4: What are the Requirements for the Success of Configuration Management?

The key requirement for success of configuration management is the commitment of all levels of management to enforcing its use throughout the project lifetime. Configuration management, like other parts of software engineering perceived as being tedious, may require some coercion for success. A further requirement is the availability of a clearly stated configuration management plan.

Q. 5: What are the Configuration Items?
