and Navigation of Robots in Extreme Environments Allahyar Montazeri, Nargess Sadeghzadeh-Nokhodberiz, Khoshnam Shojaei, Kaspar Althoefer, 2024-11-20 Advances in robotics and autonomous systems have opened new horizons for the scientists by creating new opportunities to explore extreme environments that would previously not have been possible. For example, robots that are deployed to study environmental processes such as remote volcanos monitor the climate variables under the adverse weather conditions, understand underground mines and explore deep oceans which are all inaccessible or hazardous for the human. Industrial applications can also often be situated in extreme environments such as offshore oil and gas and nuclear industries. In such applications, the autonomous robot is expected to complete tasks such as repair and maintenance, exploration, reconnaissance, inspection, and transportation which is either done in isolation or as a team of cooperative robots. Due to the harsh and severe conditions of such environments, designing an advanced robotic system that can endure them is a challenging task. The robot needs to cope with the time-varying, restricted, uncertain, and unstructured nature of the environment to achieve the planning and execution of the tasks. This in turn demands development of advanced, robust, and adaptive motion control and navigation algorithms along with machine learning and deep learning algorithms with high cognitive capability for the robot to perceive the surrounding environment effectively. The use of both single and multi-robot platforms can be advantageous depending on the specific application and environment. **Advanced**

Autonomous Vehicle Design for Severe Environments V.V. Vantsevich, M.V. Blundell, 2015-10-20 Classical vehicle dynamics, which is the basis for manned ground vehicle design, has exhausted its potential for providing novel design concepts to a large degree. At the same time, unmanned ground vehicle (UGV) dynamics is still in its infancy and is currently being developed using general analytical dynamics principles with very little input from actual vehicle dynamics theory. This technical book presents outcomes from the NATO Advanced Study Institute (ASI) Advanced Autonomous Vehicle Design for Severe Environments held in Coventry, UK, in July 2014. The ASI provided a platform for world-class professionals to meet and discuss leading-edge research, engineering accomplishments, and future trends in manned and unmanned ground vehicle dynamics, terrain mobility, and energy efficiency. The outcomes of this collective effort serve as an analytical foundation for autonomous vehicle design. Topics covered include historical aspects, pivotal accomplishments, and the analysis of future trends in on and off-road manned and unmanned vehicle dynamics, terramechanics, soil dynamic characteristics, uncertainties, and stochastic characteristics of vehicle-environment interaction for agile vehicle dynamics modeling, new methods and techniques in on-line control and learning for vehicle autonomy, fundamentals of agility in severe environments, mechatronics and cyber physics issues of agile vehicle dynamics, design for control, energy harvesting, and cyber security, and case studies of agile and inverse vehicle dynamics and vehicle systems design, including optimisation of suspension and driveline systems. The book targets graduate students who desire to advance further in leading-edge vehicle dynamics topics in manned and unmanned ground vehicles, PhD students continuing their research work, and building advanced curricula in
