Advanced Pulverized Coal Injection Technology And Blast Furnace Operation:

Advanced Pulverized Coal Injection Technology and Blast Furnace Operation K. Ishii, 2000-11-10 In order to reduce the cost of running blast furnaces BFs injected pulverized coal is used rather than coke to fire BFs As a result of this unburned fine materials are blown with the gas into the bosh and dead man areas with possible detrimental effects on gas flow and permeability of the coke column The capacity of the furnace to consume these particles by solution loss is probably one of the limitations to coal injection It is therefore important to understand the physicochemical and aerodynamic behaviour of fines including the change of in furnace phenomena The Committee of Pulverized Coal Combustion and In Furnace Reaction in BF was set up in 1993 as a cooperative research of the Japan Society for the Promotion of Science JSPS and the Iron and Steel Institute ISIJ to evaluate research initiative into this problem This book reports on the JSPS ISIJ Committee s activities and describes the interpretation of findings drawn from combustion experiments and the results of live furnace applications and furnace performance

Fundamentals and Technology of Combustion F El-Mahallawy, S. E-Din Habik, 2002-07-10 Fundamentals and Technology of Combustion contains brief descriptions of combustion fundamental processes followed by an extensive survey of the combustion research technology It also includes mathematical combustion modeling of the processes covering mainly premixed and diffusion flames where many chemical and physical processes compete in complex ways for both laminar and turbulent flows The combustion chemistry models that validate experimental data for different fuels are sufficiently accurate to allow confident predictions of the flame characteristics This illustrates a unique bridge between combustion fundamentals and combustion technology which provides a valuable technical reference for many engineers and scientists Moreover the book gives the reader sufficient background of basic engineering sciences such as chemistry thermodynamics heat transfer and fluid mechanics The combustion research and mathematical models fit between small scale laboratory burner flames and large scale industrial boilers furnaces and combustion chambers The materials have been collected from previous relevant research and some selected papers of the authors and co workers which have been presented mainly in different refereed journals international conferences and symposia thus providing a comprehensive collection Furthermore the book includes some of the many recent general correlations for the characteristics of laminar turbulent premixed and diffusion flames in an easily usable form The authors believe that further progress in optimizing combustion performance and reducing polluting emissions can only be treated through understanding of combustion chemistry
