

projective geometry, projective differential geometry, the elements of algebraic geometry and Bézier curves and surfaces. Next comes the main thrust of the book, examining line geometry from the classical perspective and also from the modern viewpoint of computing. The Klein model of line space, Plücker coordinates and the Grassmann algebra are introduced in the second chapter, followed by a chapter on linear complexes. After an interlude on approximations, the next three chapters are devoted to ruled surfaces, developable surfaces and manifolds of lines respectively. The last chapter has the most 'applied' flavour, with its emphasis on kinematic mappings, but generally this is a book of applicable geometry rather than applications of geometry. The text is complemented by hundreds of diagrams, an extensive bibliography and a relatively brief index. Perhaps the most attractive feature is the collection of beautiful colour plates. These include illustrations of the milling of a star-shaped surface, geodesics on a helical surface and what looks to me like a picture of tumbling dice, but is labelled 'affine control positions of a traditional Bézier motion'.

Advances in algebraic geometry motivated by physics, by Emma Previato (ed). Contemporary Mathematics 276. Pp. 294. £52.50. 2001. ISBN 0 8218 2810 X (American Mathematical Society).

This book has its origins in an AMS meeting on enumerative geometry in physics, held at the University of Massachusetts in April 2000. Problems and methods arising from quantum field theory, such as mirror symmetry and quantum cohomology have revitalised the study of geometry and topology in the past few decades. The algebraic geometry papers collected here are grouped into three categories: three papers on enumerative or reality problems; six papers on deformation theory, focussing on variational or moduli problems; and eight further papers on mirror symmetry and Gromov-Witten invariants.

Though *Memoirs of the AMS* carries an ISSN number, indicating a journal, it is really a book series. Each individual number, which generally consists of a research monograph well beyond the scope of the *Gazette*, also carries an ISBN number. This collection includes: a study of certain minimal surfaces defined over the complex numbers (Bauer); the geometry of variational structures and how to reduce them to quotient spaces under group actions (Cendra et al); a construction of a family of n -cycles that, amongst all n -cycles of period $n \equiv 0 \pmod{4}$, attain maximum entropy, (King and Strantzen); new results in singular quasilinear elliptic and parabolic partial differential equations (Shapiro); and a discussion of the perturbation theory on non-commutative integrable systems in the context of non-Abelian symmetry groups. Subscriptions to *Memoirs of the AMS* are the preserve of (wealthy) academic libraries: the volumes appeal predominantly to researchers who need a state-of-the-art account of a specialised sub-field of mathematical endeavour.
