Adverse Drug Reactions Jack Uetrecht, 2009-12-18 This

book provides the current state of knowledge of basic mechanisms of adverse drug reactions ADRs The main focus is on idiosyncratic drug reactions because they are the most difficult to deal with It starts with a general description of the major targets for ADRs followed by a description of what are presently believed to be mediators and biochemical pathways involved in idiosyncratic drug reactions There is also a description of several examples of ADRs that serve to illustrate specific aspects of ADR mechanisms Eventually the book shows that ultimately better methods are needed to predict which drug candidates are likely to cause ADRs and which patients are at increased risk But at present research seems to be far from this goal

Adverse Drug Reactions (ADRs) Sagar Pamu, 2018-05-14 Script from the year 2018 in the subject Medicine Pharmacology Pharmacy grade A course Pharm D language English abstract The WHO defines an Adverse Drug Reaction as any response to a drug which is noxious and unintended and which occurs or doses normally used in a man of prophylaxis diagnosis or therapy of disease or for the modification of physiologic function Adverse Drug Reactions ADRs are types of Adverse Drug Events ADEs Adverse Drug Events include ADRs prescription errors medication errors and other drug related problems ADEs are the negative consequences of drug misadventures Henri Manasse defined drug misadventure as the iatrogenic hazard that is an inherent risk when drug therapy is indicated The American Society of Health System Pharmacists ASHP defines significant ADRs as an unexpected unintended undesired or excessive response to a drug that includes the following

Pharmacogenetic biomarkers for chemotherapy-induced adverse drug reactions Niclas Björn, 2019-11-20 Cancer is a serious disease expected to be the world leading cause of death in the 21st century The use of harsh chemotherapies is motivated and accepted but unfortunately is often accompanied by severe toxicity and adverse drug reactions ADRs These occur because the classical chemotherapies common modes of action effectively kill and or reduce the growth rate not only of tumour cells but also of many other rapidly dividing healthy cells in the body There are also considerable interindividual differences in ADRs even between patients with similar cancers and disease stage treated with equal doses some experience severe to life threatening ADRs after one dose leading to treatment delays adjustments or even discontinuation resulting in suboptimal treatment while others remain unaffected through all treatment cycles Being able to predict which patients are at high or low risk of ADRs and to adjust doses accordingly before treatment would probably decrease toxicity and patient suffering while also increasing treatment tolerability and effects In this thesis we have used next generation sequencing NGS and bioinformatics for the prediction of myelosuppressive ADRs in lung and ovarian cancer patients treated with gemcitabine carboplatin and paclitaxel carboplatin Paper I shows that ABCB1 and CYP2C8 genotypes have small effects inadequate for stratification of paclitaxel carboplatin toxicity This supports the transition to whole exome sequencing WES and whole genome sequencing WGS Papers II and IV respectively use WES and WGS and demonstrate that genetic variation in or around genes involved in blood cell regulation and proliferation or genes differentially expressed at chemotherapy exposure

can be used in polygenic prediction models for stratification of gemcitabine carboplatin-induced myelosuppression Paper III reassuringly shows that WES and WGS are concordant and mostly yield comparable genotypes across the exome Paper V proves that single cell RNA sequencing of hematopoietic stem cells is a feasible method for elucidating differential transcriptional effects induced as a response to in vitro chemotherapy treatment In conclusion our results support the transition to genome wide approaches using WES WGS and RNA sequencing to establish polygenic models that combine effects of multiple pharmacogenetic biomarkers for predicting chemotherapy induced ADRs This approach could be applied to improve risk stratification and our understanding of toxicity and ADRs related to other drugs and diseases We hope that our myelosuppression prediction models can be refined and validated to facilitate personalized treatments leading to increased patient wellbeing and quality of life
