1990 Triton Charging System:

Electrifying Atmospheres: Charging, Ionisation and Lightning in the Solar System and Beyond Karen Aplin, 2013-05-14

Electrical processes take place in all planetary atmospheres. There is evidence for lightning on Venus, Jupiter, Saturn, Uranus and Neptune; it is possible on Mars and Titan, and cosmic rays ionise every atmosphere leading to charged droplets and particles. Controversy surrounds the role of atmospheric electricity in physical climate processes on Earth; here a comparative approach is employed to review the role of electrification in the atmospheres of other planets and their moons. This book reviews the theory and where available measurements of planetary atmospheric electricity taken to include ion production and ion aerosol interactions. The conditions necessary for a global atmospheric electric circuit similar to Earth's and the likelihood of meeting these conditions in other planetary atmospheres are briefly discussed. Atmospheric electrification is more important at planets receiving little solar radiation, increasing the relative significance of electrical forces. Nucleation onto atmospheric ions has been predicted to affect the evolution and lifetime of haze layers on Titan, Neptune and Triton. For planets closer to Earth, heating from solar radiation dominates atmospheric circulations. Mars may have a global circuit analogous to the terrestrial model but based on electrical discharges from dust storms, and Titan may have a similar global circuit based on transfer of charged raindrops. There is an increasing need for direct measurements of planetary atmospheric electrification, in particular on Mars, to assess the risk for future unmanned and manned missions. Theoretical understanding could be increased by cross-disciplinary work to modify and update models and parameterisations initially developed for a specific atmosphere to make them more broadly applicable to other planetary atmospheres. The possibility of electrical processes in the atmospheres of exoplanets is also discussed.

Neptune and Triton Dale P. Cruikshank, Mildred Shapley Matthews, A. M. Schumann, 1995-11

The first reconnaissance of all the major planets of the Solar System culminated in the Voyager 2 encounter with Neptune in August 1989. Neptune itself was revealed as a planet with gigantic active storms in its atmosphere and off-center magnetic field and a system of tenuous lumpy rings. Whereas only two satellites were known prior to the encounter, Voyager discovered six more. Triton, the largest satellite, was revealed as a frozen icy world with clouds and layers of haze and with vertical plumes of particles reaching five miles into the thin atmosphere. This latest Space Science Series volume presents the current level of understanding of Neptune, its rings and its satellites derived from the data received from the Voyager. The book's chapters are written by the world's leading authorities on various aspects of the Neptune system and are based on papers presented at an international conference held in January 1992. Covering details of Neptune's interior atmosphere, rings, magnetic fields and near-space environment as well as the small satellites and the remarkable moon Triton, this volume is a unique resource for planetary scientists and astronomers requiring a comprehensive analysis of Neptune viewed in the context of our knowledge of the other giant planets. Until another spacecraft is sent to Neptune, Neptune and Triton will stand as the basic reference on the planet.

Wittenmayer,2006-05-18 The world's population is expected to reach 8 billion by 2025 and most of this growth in population will occur in developing countries To feed the world with such a marked increase in population a great improvement in food production must be achieved particularly in these countries To meet this challenge present agricultural productivity must be increased on the cultivated land However in many developing countries particularly in Africa reduced soil fertility caused by continuous cropping with low nutrient input and the resultant nutrient mining of soils is a major threat both to food production and to ecosystem viability As a result of declining soil fertility together with increasing population pressure expansion of crop production to marginal lands and forested areas contribute to the destruction of natural ecosystems Food production is not only a quantitative challenge Improving the nutrient status of plants provides a further valuable means of enhancing food quality and is of extreme benefit to the health of both plants and humans There are several excellent examples showing that plants with optimum nutrient status are better adapted to biotic and abiotic stress factors Because of population pressures many global food systems are not currently providing enough micronutrients to ensure adequate micronutrient intakes in the human diet This has resulted in an increasing prevalence of micronutrient deficiencies that now afflicts over three billion people worldwide **Cumulated Index Medicus** ,1991 **Government Reports Announcements & Index** ,1991
