Complete Chemistry is a revised and enlarged edition of the popular GCSE Chemistry improved to bring it totally up to date. This book covers all syllabuses with core material for Double Award and extension material for Science Chemistry. The breadth and depth is sufficient to stretch your students aiming for the top grades and makes it an excellent foundation for those intending to progress to advanced level chemistry. Key Points Now includes all the necessary topics for IGCSE Concepts and principles of chemistry presented in a clear straightforward style. Lively and colourful coverage of the relevance of chemistry in the real world. End of chapter testing with more challenging and structured questions. Examination style questions. Pagination remains the same as GCSE Chemistry so that the two can be used alongside each other. **Commonly Asked Questions in Thermodynamics** Marc J. Assael, Geoffrey C. Maitland, Thomas Maskow, Urs von Stockar, William A. Wakeham, Stefan Will, 2022-08-05. CRC Press is pleased to introduce the new edition of Commonly Asked Questions in Thermodynamics, an indispensable resource for those in modern science and engineering disciplines from molecular science, engineering and biotechnology to astrophysics. Fully updated throughout, this edition features two new chapters focused on energy utilization and biological systems. This edition begins by setting out the fundamentals of thermodynamics, including its basic laws and overarching principles. It provides explanations of those principles in an organized manner using questions that arise frequently from undergraduates in the classroom as the stimulus. These early chapters explore the language of thermodynamics, the first and second laws, statistical mechanical theory, measurement of thermodynamic quantities and their relationships, phase behavior in single and multicomponent systems, electrochemistry and chemical and biochemical reaction equilibria. The later chapters explore applications of these fundamentals to a diverse set of subjects including power generation with and without fossil fuels for transport, industrial and domestic use, heating, decarbonization technologies, energy storage, refrigeration, environmental pollution and biotechnology. Data sources for the properties needed to complete thermodynamic evaluations of many processes are included. The text is designed for readers to dip into to find an answer to a specific question where thermodynamics can provide some, if not all, of the answers, whether in the context of an undergraduate course or not. Thus its readership extends beyond conventional technical undergraduates to practicing engineers and also to the interested lay person who seeks to understand the discourse that surrounds the choice of particular technological solutions to current and future energy and material production problems.
