Atmospheric Pressure Plasma For Surface Modification:

Atmospheric Pressure Plasma Treatment of Polymers Michael Thomas, K. L. Mittal, 2013-06-19 An indispensable volume detailing the current and potential applications of atmospheric pressure plasma treatment by experts practicing in fields around the world. Polymers are used in a wide variety of industries to fabricate legions of products because of their many desirable traits. However, polymers in general and polyolefins in particular are innately not very adhesionable because of the absence of polar or reactive groups on their surfaces and concomitant low surface energy. Surface treatment of polymers however is essential to impart reactive chemical groups on their surfaces to enhance their adhesion characteristic. Proper surface treatment can endow polymers with improved adhesion without affecting the bulk properties. A plethora of techniques ranging from wet to dry, simple to sophisticated, vacuum to non vacuum for polymer surface modification have been documented in the literature but the Atmospheric Pressure Plasma (APP) treatment has attracted much attention because it offers many advantages vis-à-vis other techniques, namely uniform treatment, continuous operation, no need for vacuum, simplicity, low cost, no environmental or disposal concern, and applicability to large area samples. Although the emphasis in this book is on the utility of APP treatment for enhancement of polymer adhesion, APP is also applicable and effective to modulate many other surface properties of polymers: superhydrophilicity, superhydrophobicity, anti-fouling, anti-fogging, anti-icing, cell adhesion, biocompatibility, tribological behavior, etc. The key features of Atmospheric Pressure Plasma Treatment of Polymers: Address design and functions of various types of reactors; Bring out current and potential applications of APP treatment; Represent the cumulative wisdom of many key academic and industry researchers actively engaged in this key and enabling technology.

Atmospheric Pressure Plasma for Surface Modification Rory A. Wolf, 2012-11-08 This book's focus and intent is to impart an understanding of the practical application of atmospheric plasma for the advancement of a wide range of current and emerging technologies. The primary key feature of this book is the introduction of over thirteen years of practical experimental evidence of successful surface modifications by atmospheric plasma methods. It offers a handbook-based approach for leveraging and optimizing atmospheric plasma technologies which are currently in commercial use. It also offers a complete treatment of both basic plasma physics and industrial plasma processing with the intention of becoming a primary reference for students and professionals. The reader will learn the mechanisms which control and operate atmospheric plasma technologies and how these technologies can be leveraged to develop in-line continuous processing of a wide variety of substrates. Readers will gain an understanding of specific surface modification effects by atmospheric plasmas and how to best characterize those modifications to optimize surface cleaning and functionalization for adhesion promotion. The book also features a series of chapters written to address practical surface modification effects of atmospheric plasmas within specific application markets and a commercially focused assessment of those effects.

special care should be taken for surface activation of textiles due to their complex geometries. It was found that modification is strongly influenced by both plasma parameters and fabric structure. As compared to air, CO₂ and water vapor, Ar, O₂ and He/O₂ mixtures were found to be very effective for surface hydrophilization of polyester textiles due to the long lasting free radical lifetimes. The modified surfaces were not stable for a long time due to restructuring of the polar functional groups. Therefore plasma coatings containing functional groups are required in order to obtain a permanent surface modification. Permanent nanoporous coatings were deposited in order to obtain functional surfaces which contain accessible functionalities within the entire coating volume. This novel approach is essentially based on a fine control of simultaneous deposition and etching processes during plasma copolymerization of ammonia with hydrocarbons. A nanoporous structure with a large specific surface area was achieved that contained functional groups inside the coating volume which were accessible to e.g. dye molecules thus facilitating substrate independent dyeing. A permanent hydrophilic modification of material surfaces was obtained by introducing nitrogen polar functionalities depending on the NH₃ to hydrocarbon ratio which is mostly due to a replacement of carbon in a C-H-N films. This novel combination of polar groups with a suitable texturing realized within crosslinked aC-H-N coatings proved to be an efficient method providing a long term mechanical stability of superhydrophilic coatings. Moreover plasma coated material surfaces contain huge numbers of functional groups which can chemically interact with matrix materials and hence yield strong covalent bond between fiber and matrix. The coatings show a large surface area which enhances the contact area and surface texturing and additionally promotes mechanical interlocking. Thus the novel developed nanoporous coatings represent a platform for diverse multifunctional applications in the surface enhancement of advanced materials.

Surface Modification to Improve Properties of

Materials Miran Mozetič, 2019-04-16 This book contains selected contributions on surface modification to improve the properties of solid materials. The surface properties are tailored either by functionalization, etching or deposition of a thin coating. Functionalization is achieved by a brief treatment with non equilibrium gaseous plasma containing suitable radicals that interact chemically with the material surface and thus enable the formation of rather stable functional groups. Etching is performed in order to modify the surface morphology. The etching parameters are selected in such a way that a rich morphology of the surfaces is achieved spontaneously on the sub micrometer scale without using masks. The combination of adequate surface morphology and functionalization of materials leads to superior surface properties which are particularly beneficial for the desired response upon incubation with biological matter. Alternatively the materials are coated with a suitable thin film that is useful in various applications from food to aerospace industries.
