Spectral Theory of Non-Commutative Harmonic Oscillators: An Introduction Alberto Parmeggiani, 2010-07-23

This book grew out of a series of lectures given at the Mathematics Department of Kyushu University in the Fall 2006 within the support of the 21st Century COE Program 2003-2007 Development of Dynamical Mathematics with High Functionality Program Leader prof Mitsuhiro Nakao. It was initially published as the Kyushu University COE Lecture Note number 8 COE Lecture Note 8 Kyushu University The 21st Century COE Program DMHF Fukuoka 2008 vi+234 pp and in the present form is an extended version of it in particular I have added a section dedicated to the Maslov index. The book is intended as a rapid though not so straightforward pseudodifferential introduction to the spectral theory of certain systems mainly of the form $a = \sum_{|\alpha| \leq 2} a_\alpha x^\alpha$ where the entries of a are homogeneous polynomials of degree 2 in the $2n$ variables $x \in \mathbb{R}^n$ and a is a constant matrix. The book also treats the so-called noncommutative harmonic oscillators with particular emphasis on a class of systems introduced by M. Wakayama and myself about ten years ago. The class of noncommutative harmonic oscillators is very rich and many problems are still open and worth of being pursued.

Vector fields on Singular Varieties Jean-Paul Brasselet, José Seade, Tatsuo Suwa, 2009-11-28

Many authors have questioned the use of the index of the vector field and of the Chern classes if the underlying space becomes singular. This book discusses their explorations within the framework of the obstruction theory and the Chern-Weil theory.

Generalized Bessel Functions of the First Kind Árpád Baricz, 2010-06-17

In this volume we study the generalized Bessel functions of the first kind by using a number of classical and new findings in complex and classical analysis. Our aim is to present interesting geometric properties and functional inequalities for these generalized Bessel functions. Moreover, we extend many known inequalities involving circular and hyperbolic functions to Bessel and modified Bessel functions.

Banach Spaces and Descriptive Set Theory: Selected Topics Pandelis Dodos, 2010-04-15

These notes are devoted to the study of some classical problems in the Geometry of Banach spaces. The novelty lies in the fact that their solution relies heavily on techniques coming from Descriptive Set Theory. The central theme is universality problems. In particular, the text provides an exposition of the methods developed recently in order to treat questions of the following type: Let $\mathcal{C}$ be a class of separable Banach spaces such that every space X in the class $\mathcal{C}$ has a certain property, say property P . When can we find a separable Banach space Y which has property P and contains an isomorphic copy of every member of $\mathcal{C}$? We will consider quite classical properties of Banach spaces such as being reflexive, having separable dual, not containing an isomorphic copy of c_0 , being non-universal, etc. It turns out that a positive answer to problem Q for any of the above mentioned properties is possible if and essentially only if the class $\mathcal{C}$ is simple. The simplicity of $\mathcal{C}$ is measured in set-theoretic terms. Precisely, if the class $\mathcal{C}$ is analytic in a natural coding of separable Banach spaces, then we can indeed find a separable space Y which is universal for the class $\mathcal{C}$ and satisfies the requirements imposed above.

Controllability of Partial Differential Equations Governed by Multiplicative Controls Alexander Y. Khapalov, 2010-05-19

This monograph

addresses the global controllability of partial differential equations in the context of multiplicative or bilinear controls which enter the model equations as coefficients The methodology is illustrated with a variety of model equations

Nonlinear Optimization Immanuel M. Bomze, Vladimir F. Demyanov, Roger Fletcher, Tamás Terlaky, 2010-03-17 This volume collects the expanded notes of four series of lectures given on the occasion of the CIME course on Nonlinear Optimization held in Cetraro Italy from July 1 to 7 2007 The Nonlinear Optimization problem of main concern here is the problem of determining a vector of decision variables $x \in \mathbb{R}^n$ that minimizes an objective function $f: \mathbb{R}^n \rightarrow \mathbb{R}$ when x is restricted to belong to some feasible set $F \subset \mathbb{R}^n$ usually described by a set of equality and inequality constraints $F = \{x \in \mathbb{R}^n \mid h(x) = 0, g(x) \leq 0\}$ of course it is intended that at least one of the functions f, h, g is nonlinear Although the problem can be stated in very simple terms its solution may result very difficult due to the analytical properties of the functions involved and/or to the number of variables and constraints On the other hand the problem has been recognized to be of main relevance in engineering economics and other applied sciences so that a great lot of effort has been devoted to develop methods and algorithms able to solve the problem even in its more difficult and large instances The lectures have been given by eminent scholars who contributed to a great extent to the development of Nonlinear Optimization theory methods and algorithms Namely they are Professor Immanuel M. Bomze, Vladimir F. Demyanov, Roger Fletcher, Tamás Terlaky, 2010-03-17

Pseudo-Differential Operators Hans G. Feichtinger, Bernard Helffer, Michael Lamoureux, Nicolas Lerner, Joachim Toft, 2008-08-11 Pseudo differential operators were initiated by Kohn Nirenberg and Hormander in the sixties of the last century Beside applications in the general theory of partial differential equations they have their roots also in the study of quantization first envisaged by Hermann Weyl thirty years earlier Thanks to the understanding of the connections of wavelets with other branches of mathematical analysis quantum physics and engineering such operators have been used under different names as mathematical models in signal analysis since the last decade of the last century The volume investigates the mathematics of quantization and signals in the context of pseudo differential operators Weyl transforms Daubechies operators Wick quantization and time frequency localization operators Applications to quantization signal analysis and the modern theory of PDE are highlighted

Séminaire de Probabilités XLII Catherine Donati-Martin, Michel Émery, Alain Rouault, Christophe Stricker, 2009-06-29 This book offers an introduction to rough paths Coverage also includes the interface between analysis and probability to special processes Lévy processes and Lévy systems representation of Gaussian processes filtrations and quantum probability

Structured Population Models in Biology and Epidemiology Pierre Magal, Shigui Ruan, 2008-04-30 In this new century mankind faces ever more challenging environmental and public health problems such as pollution invasion by exotic species the emergence of new diseases or the emergence of diseases into new regions West Nile virus SARS Anthrax etc and the resurgence of existing diseases in malaria TB HIV AIDS etc Mathematical models have been successfully used to study many biological epidemiological and medical problems and nonlinear and complex dynamics have been observed in all of those contexts Mathematical studies

have helped us not only to better understand these problems but also to find solutions in some cases such as the prediction and control of SARS outbreaks understanding HIV infection and the investigation of antibiotic resistant infections in hospitals. Structured population models distinguish individuals from one another according to characteristics such as age size location status and movement to determine the birth growth and death rates interaction with each other and with environment infectivity etc. The goal of structured population models is to understand how these characteristics affect the dynamics of these models and thus the outcomes and consequences of the biological and epidemiological processes. There is a very large and growing body of literature on these topics. This book deals with the recent and important advances in the study of structured population models in biology and epidemiology. There are six chapters in this book written by leading researchers in these areas.

Equilibrium States and the Ergodic Theory of Anosov Diffeomorphisms Robert Edward Bowen, 2008-04-18. For this printing of R. Bowen's book J. R. Chazottes has retyped it in TeX for easier reading thereby correcting typos and bibliographic details. From the Preface by D. Ruelle: Rufus Bowen has left us a masterpiece of mathematical exposition. Here a number of results which were new at the time are presented in such a clear and lucid style that Bowen's monograph immediately became a classic. More than thirty years later many new results have been proved in this area but the volume is as useful as ever because it remains the best introduction to the basics of the ergodic theory of hyperbolic systems.

Mathematical Theory of Feynman Path Integrals Sergio Albeverio, Rafael Høegh-Krohn, Sonia Mazzucchi, 2008-05-30. The 2nd edition of LNM 523 is based on the two first authors' mathematical approach of this theory presented in its 1st edition in 1976. An entire new chapter on the current forefront of research has been added. Except for this new chapter and the correction of a few misprints the basic material and presentation of the first edition has been maintained. At the end of each chapter the reader will also find notes with further bibliographical information.

Simplicial Complexes of Graphs Jakob Jonsson, 2007-11-15. A graph complex is a finite family of graphs closed under deletion of edges. Graph complexes show up naturally in many different areas of mathematics. Identifying each graph with its edge set one may view a graph complex as a simplicial complex and hence interpret it as a geometric object. This volume examines topological properties of graph complexes focusing on homotopy type and homology. Many of the proofs are based on Robin Forman's discrete version of Morse theory.

Lectures on Symplectic Geometry Ana Cannas da Silva, 2004-10-27. The goal of these notes is to provide a fast introduction to symplectic geometry for graduate students with some knowledge of differential geometry de Rham theory and classical Lie groups. This text addresses symplectomorphisms local forms contact manifolds compatible almost complex structures Kaehler manifolds hamiltonian mechanics moment maps symplectic reduction and symplectic toric manifolds. It contains guided problems called homework designed to complement the exposition or extend the reader's understanding. There are by now excellent references on symplectic geometry a subset of which is in the bibliography of this book. However the most efficient introduction to a subject is often a short elementary treatment and these notes attempt to

serve that purpose This text provides a taste of areas of current research and will prepare the reader to explore recent papers and extensive books on symplectic geometry where the pace is much faster For this reprint numerous corrections and clarifications have been made and the layout has been improved Mathematical Epidemiology Fred Brauer,Pauline van den Driessche,J. Wu,2008-04-30 Based on lecture notes of two summer schools with a mixed audience from mathematical sciences epidemiology and public health this volume offers a comprehensive introduction to basic ideas and techniques in modeling infectious diseases for the comparison of strategies to plan for an anticipated epidemic or pandemic and to deal with a disease outbreak in real time It covers detailed case studies for diseases including pandemic influenza West Nile virus and childhood diseases Models for other diseases including Severe Acute Respiratory Syndrome fox rabies and sexually transmitted infections are included as applications Its chapters are coherent and complementary independent units In order to accustom students to look at the current literature and to experience different perspectives no attempt has been made to achieve united writing style or unified notation Notes on some mathematical background calculus matrix algebra differential equations and probability have been prepared and may be downloaded at the web site of the Centre for Disease Modeling www.cdm.yorku.ca Stochastic Calculus for Fractional Brownian Motion and Related Processes Iñaki Ullucili S. Mishura,2008-01-02 This volume examines the theory of fractional Brownian motion and other long memory processes Interesting topics for PhD students and specialists in probability theory stochastic analysis and financial mathematics demonstrate the modern level of this field It proves that the market with stock guided by the mixed model is arbitrage free without any restriction on the dependence of the components and deduces different forms of the Black Scholes equation for fractional market **Calculus of Variations and Nonlinear Partial Differential Equations** Luigi Ambrosio,E. Mascolo,2008-01-02 With a historical overview by Elvira Mascolo Boundary Value Problems and Markov Processes Kazuaki Taira,2009-06-30 This is a thorough and accessible exposition on the functional analytic approach to the problem of construction of Markov processes with Ventcel boundary conditions in probability theory It presents new developments in the theory of singular integrals **Harmonic and Complex Analysis and its Applications** Alexander Vasil'ev,2013-11-09 This volume highlights the main results of the research performed within the network Harmonic and Complex Analysis and its Applications HCAA which was a five year 2007 2012 European Science Foundation Programme intended to explore and to strengthen the bridge between two scientific communities analysts with broad backgrounds in complex and harmonic analysis and mathematical physics and specialists in physics and applied sciences It coordinated actions for advancing harmonic and complex analysis and for expanding its application to challenging scientific problems Particular topics considered by this Programme included conformal and quasiconformal mappings potential theory Banach spaces of analytic functions and their applications to the problems of fluid mechanics conformal field theory Hamiltonian and Lagrangian mechanics and signal processing This book is a collection of surveys written as a result of activities of the Programme and

will be interesting and useful for professionals and novices in analysis and mathematical physics as well as for graduate students. Browsing the volume the reader will undoubtedly notice that as the scope of the Programme is rather broad there are many interrelations between the various contributions which can be regarded as different facets of a common theme.

Polyharmonic Boundary Value Problems Filippo Gazzola, Hans-Christoph Grunau, Guido Sweers, 2010-05-26 This accessible monograph covers higher order linear and nonlinear elliptic boundary value problems in bounded domains mainly with the biharmonic or poly harmonic operator as leading principal part. It provides rapid access to recent results and references.

Stability of Nonautonomous Differential Equations Luis Barreira, Claudia Valls, 2007-09-26 This volume covers the stability of nonautonomous differential equations in Banach spaces in the presence of nonuniform hyperbolicity. Topics under discussion include the Lyapunov stability of solutions, the existence and smoothness of invariant manifolds and the construction and regularity of topological conjugacies. The exposition is directed to researchers as well as graduate students interested in differential equations and dynamical systems particularly in stability theory.
