Atomic Scale Characterization and First-Principles Studies of Si₃N₄ Interfaces Weronika Walkosz, 2011-04-06 This thesis presents results from a combined atomic resolution Z contrast and annular bright field imaging and electron energy loss spectroscopy in the Scanning Transmission Electron Microscopy as well as first principles studies of the interfaces between crystalline Si₃N₄ and amorphous i CeO₂ x as well as ii SiO₂ intergranular film IGF These interfaces are of a great fundamental and technological interest because they play an important role in the microstructural evolution and mechanical properties of Si₃N₄ ceramics used in many high temperature and pressure applications The main contribution of this work is its detailed description of the bonding characteristics of light atoms in particular oxygen and nitrogen at these interfaces which has not been achieved before The atomic scale information on the arrangement of both light and heavy atoms is critical for realistic modeling of interface properties such as interface strength and ion transport and will facilitate increased control over the performance of ceramic and semiconductor materials for a wide range of applications
