1. *Journal of the American Medical Association*, 2000; 284: 2689-2695.

1. **What is the purpose of the study?**
The purpose of the study is to investigate the effect of the use of a mobile learning application on the learning outcomes of students in a distance education program.

2. **What are the research objectives?**
The research objectives are to determine the effect of the use of a mobile learning application on the learning outcomes of students in a distance education program, to determine the effect of the use of a mobile learning application on the learning outcomes of students in a distance education program, and to determine the effect of the use of a mobile learning application on the learning outcomes of students in a distance education program.

3. **What is the research methodology?**
The research methodology is a quantitative research design, using a pre-test/post-test control group design. The data were collected from 60 students who were divided into two groups: the experimental group and the control group. The experimental group used the mobile learning application, while the control group did not use it. The data were collected at two time points: before and after the intervention.

4. **What are the results of the study?**
The results of the study show that the use of the mobile learning application had a significant positive effect on the learning outcomes of students in a distance education program. The experimental group showed significantly higher learning outcomes than the control group, both before and after the intervention.

5. **What are the conclusions of the study?**
The conclusions of the study are that the use of a mobile learning application has a positive effect on the learning outcomes of students in a distance education program. The results of the study suggest that the use of a mobile learning application can be an effective tool for improving learning outcomes in a distance education program.

RESEARCH DESIGN AND METHODS

A cross-sectional study was conducted in 2002 in the city of São Paulo, Brazil. The study population was composed of 1,000 randomly selected individuals aged 18 years and older, living in the city of São Paulo. The sampling was done by means of a probability proportional to size method, using the 2000 Census data. The study was approved by the Research Ethics Committee of the University of São Paulo.

The data were collected by means of a structured questionnaire, which was administered by trained interviewers. The questionnaire covered the following variables: demographic characteristics (age, sex, education, income, occupation), lifestyle (smoking, alcohol consumption, physical activity), and health status (self-rated health, chronic diseases, use of medications). The questionnaire was administered in Portuguese and took approximately 10 minutes to complete.

The data were analyzed using the Statistical Package for the Social Sciences (SPSS) version 11.5 for Windows. The chi-square test was used to assess the association between the variables. The level of significance was set at 5%.

RESULTS

The study included 1,000 individuals, with a response rate of 95%. The mean age of the participants was 45.5 years, with a range from 18 to 85 years. The majority of the participants were female (58.5%) and had a high school education (65.5%). The mean monthly income was R\$1,200.00 (US\$240.00).

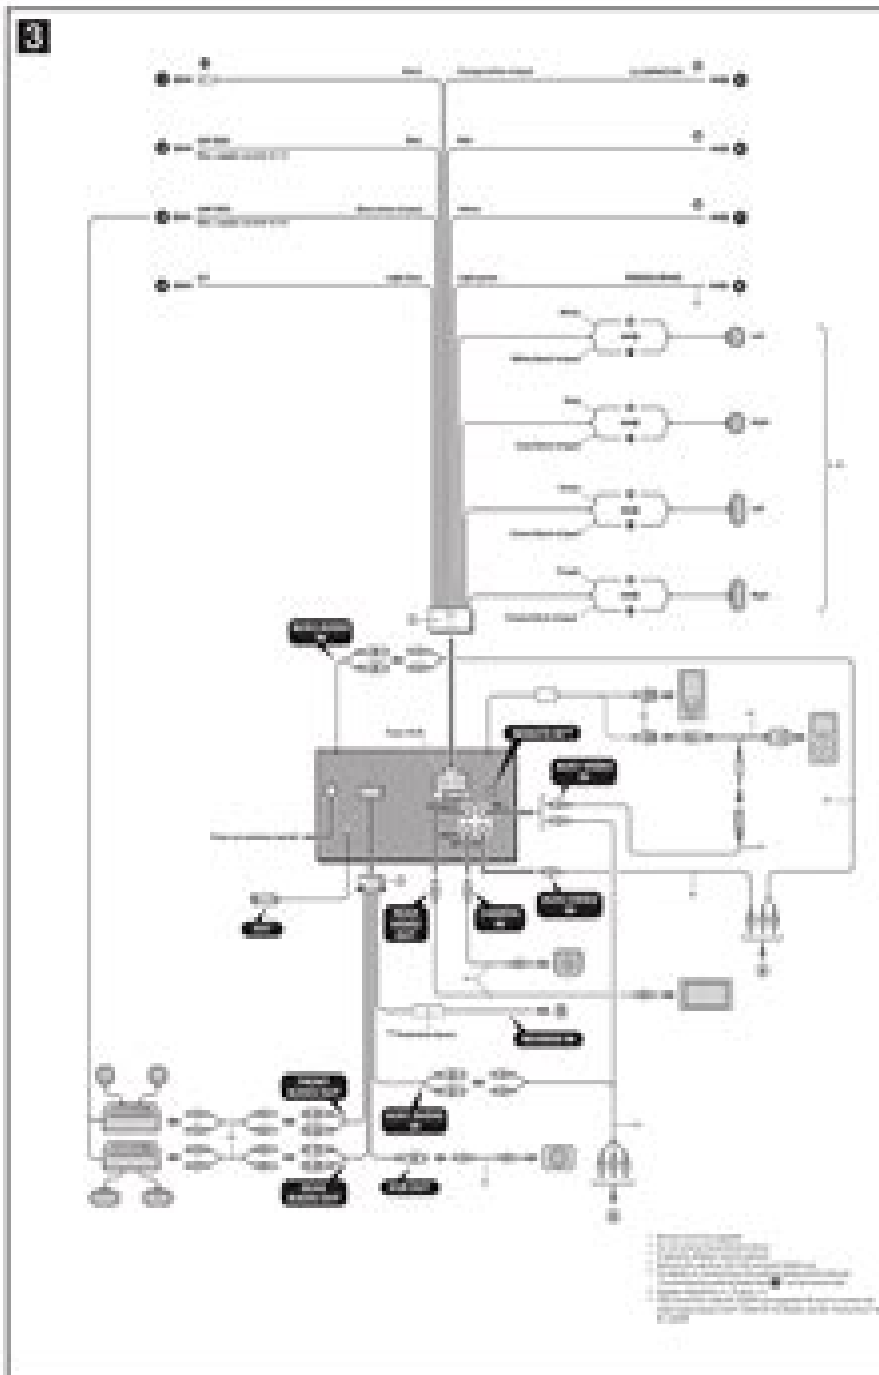

The most common self-rated health status was "good" (65.5%), followed by "fair" (25.5%), "poor" (8.5%), and "very poor" (0.5%). The most common chronic diseases were hypertension (35.5%), diabetes (15.5%), and asthma (10.5%). The most common use of medications was for hypertension (35.5%), followed by diabetes (15.5%) and asthma (10.5%).

The association between self-rated health status and chronic diseases was significant (p < 0.05). The odds ratio for having a chronic disease in individuals with "good" self-rated health was 0.5 (95% CI 0.3-0.8), while for individuals with "fair" self-rated health it was 1.5 (95% CI 1.0-2.2), and for individuals with "poor" self-rated health it was 2.5 (95% CI 1.5-4.0).

The association between self-rated health status and use of medications was also significant (p < 0.05). The odds ratio for using medications in individuals with "good" self-rated health was 0.5 (95% CI 0.3-0.8), while for individuals with "fair" self-rated health it was 1.5 (95% CI 1.0-2.2), and for individuals with "poor" self-rated health it was 2.5 (95% CI 1.5-4.0).

CONCLUSIONS

The study found that self-rated health status is a strong predictor of chronic diseases and use of medications. Individuals with "good" self-rated health have a lower risk of having chronic diseases and using medications, while individuals with "poor" self-rated health have a higher risk. These findings suggest that self-rated health status should be considered a key factor in the assessment of health status and the development of health interventions.
