**Atmosphere, Ocean and Climate Dynamics** John Marshall, R. Alan Plumb, 2007-12-19 For advanced undergraduate and beginning graduate students in atmospheric oceanic and climate science Atmosphere Ocean and Climate Dynamics is an introductory textbook on the circulations of the atmosphere and ocean and their interaction with an emphasis on global scales It will give students a good grasp of what the atmosphere and oceans look like on the large scale and why they look that way The role of the oceans in climate and paleoclimate is also discussed The combination of observations theory and accompanying illustrative laboratory experiments sets this text apart by making it accessible to students with no prior training in meteorology or oceanography Written at a mathematical level that is appealing for undergraduates and beginning graduate students Provides a useful educational tool through a combination of observations and laboratory demonstrations which can be viewed over the web Contains instructions on how to reproduce the simple but informative laboratory experiments Includes copious problems with sample answers to help students learn the material

**Geophysical Fluid Dynamics II** Emin Özsoy, 2021-08-13 This book develops a fundamental understanding of geophysical fluid dynamics based on a mathematical description of the flows of inhomogeneous fluids It covers these topics 1 development of the equations of motion for an inhomogeneous fluid 2 review of thermodynamics 3 thermodynamic and kinetic energy equations 4 equations of state for the atmosphere and the ocean salt and moisture effects 5 concepts of potential temperature and potential density 6 Boussinesq and quasi geostrophic approximations 7 conservation equations for vorticity mechanical and thermal energy instability theories internal waves mixing convection double diffusion stratified turbulence fronts intrusions gravity currents Graduate students will be able to learn and apply the basic theory of geophysical fluid dynamics of inhomogeneous fluids on a rotating earth including 1 derivation of the governing equations for a stratified fluid starting from basic principles of physics 2 review of thermodynamics equations of state isothermal adiabatic isentropic changes 3 scaling of the equations Boussinesq approximation applied to the ocean and the atmosphere 4 examples of stratified flows at geophysical scales steady and unsteady motions inertia gravity internal waves quasi geostrophic theory 5 vorticity and energy conservation in stratified fluids 6 boundary layer convection in stratified containers and basins

**Climate of the Past, Present and Future** Javier Vinós, 2022-09-20 This book is an unorthodox ground breaking scientific study on natural climate change and its contribution to ongoing multi centennial global warming The book critically reviews the effect of the following on climate Milankovitch cycles abrupt glacial Dansgaard Oeschger events Holocene climate variability the 1500 year cycle solar activity volcanic eruptions greenhouse gases energy transport Applying the scientific method to available evidence reveals that some of these phenomena are profoundly misunderstood by most researchers Milankovitch cycles are tied to orbital obliquity not to orbital precessional summer insolation glacial megatides might have triggered abrupt Dansgaard Oeschger events and tides are likely responsible for the related 1500 year climate cycle Climate change affects volcanic eruptions more than the opposite

and secular variations in solar activity are more important to climate change during the Holocene than greenhouse gases. In this book we see how important natural climate change has been on human societies of the past. It also produces new climate projections for the 21st century and when the next glaciation could happen. What emerges from this study of natural climate change is a central theme: Variations in the transport of energy from the tropics to the poles have been neglected as a cause of climate change and solar activity variations affect climate by modulating this transport. The author tells us: Transporting more energy from a greenhouse gas rich region (the tropics) to a greenhouse gas poor region (the poles) increases the amount of energy lost at the top of the atmosphere. The effect resembles a reduction in the greenhouse gas content. The book presents the Winter Gatekeeper Hypothesis on how variations in solar activity regulate Earth's energy transport and in so doing affect atmospheric circulation, the rotation of the planet, and the El Niño/Southern Oscillation. This book is oriented toward students and academics in the climate sciences and climate anthropology and should also appeal to readers interested in the science of natural climate change. The repercussions of *Climate of the Past: Present and Future* are far reaching. By uncovering a strong natural climate change component, it provides a novel view of anthropogenic climate change, fossil energy use, and our future climate—a view quite different from the IPCC's gloomy projections.

**Perspectives on the Age of the Earth and Why They Matter** Francis Ö. Dudás, 2020-02-13. Polls show almost half of US adults believe that Earth is only 10,000 years old, whereas scientists consider our planet to be 4.56 billion years old. Examining these conflicting views illuminates aspects of the perceived conflict between religion and science and helps us understand the battles between evolutionist and creationist advocates. This book examines how we approach knowledge and how we look at certainty. It disentangles the threads of the traditional knowledge we are taught from the knowledge we gain from our own investigation of truth. It argues that nature, the basis of science, and scripture, the basis of religion, derive from a single source. Because of their shared origins, religious and scientific perspectives grounded in verifiable truths must be in harmony. The book presents the science behind the reliability of isotopic dates and critiques young earth creationist attacks on isotopic studies. Though the nature of time is a philosophical issue, its measurement is a scientific venture that has affirmed that Earth is 4.56 billion years old. The harmony of science and religion based on recognition of their single source is a prerequisite for the progress of humanity as a whole.
