Transport Properties of Organic Liquids G. Latini, R. Cocci Grifoni, G. Passerini, 2006 The liquid state is possibly the most difficult and intriguing state of matter to model Organic liquids are required mainly as working fluids in almost all industrial activities and in most appliances e g in air conditioning Transport properties namely dynamic viscosity and thermal conductivity are possibly the most important properties for the design of devices and appliances Most theoretical studies on the liquid state date back to the Fifties however huge advances in experimental studies and applied research on heat and mass transfer in liquids have been achieved during past decades Most of the models cannot rely on theory alone and are empirical while for most organic liquids only a few experimental points and empirical correlations are available in literature The aim of this book is to present both theoretical approaches and the latest experimental advances on the issue and to merge them into a wider approach The book is organised into five chapters The first chapter presents our theoretical knowledge of the liquid state The second presents the tentative models for the evaluation of the thermal conductivity of organic liquids and confronts their results with the experimental data available in literature The third presents the tentative models for the evaluation of the dynamic viscosity of organic liquids and confronts their results with the experimental data available in literature The fourth presents a deeper review of the choice methods for thermal conductivity and their applications to mixtures of organic liquids and the fifth chapter presents a deeper review of the choice methods for dynamic viscosity and their applications to mixtures of organic liquids

Atmosphere-ocean Interactions William Allan Perrie, 2002 The increase in levels of population and human development in coastal areas has led to a greater importance of understanding atmosphere ocean interactions This second volume on atmosphere ocean interactions aims to present several of the key mechanisms that are important for the development of marine storms

Advances in Fluid Dynamics with emphasis on Multiphase and Complex Flow S. Hernández, P. Vorobieff, 2021-08-31 The field of fluid mechanics is vast and has numerous and diverse applications Presented papers from the 11th International Conference on Advances in Fluid Dynamics with emphasis on Multiphase and Complex Flow are contained in this book and cover a wide range of topics including basic formulations and their computer modelling as well as the relationship between experimental and analytical results Innovation in fluid structure approaches including emerging applications as energy harvesting systems studies of turbulent flows at high Reynold number or subsonic and hypersonic flows are also among the topics covered The emphasis placed on multiphase flow in the included research works is due to the fact that fluid dynamics processes in nature are predominantly multi phased i e involving more than one phase of a component such as liquid gas or plasma The range of related problems of interest is vast astrophysics biology geophysics atmospheric processes and a large variety of engineering applications Multiphase fluid dynamics are generating a great deal of interest leading to many notable advances in experimental analytical and numerical studies in this area While progress is continuing in all three categories advances in numerical solutions are likely the most conspicuous owing to the continuing improvements in computer power and the software tools available to researchers

Progress in numerical methods has not only allowed for the solution of many practical problems but also helped to improve our understanding of the physics involved. Many unresolved issues are inherent in the very definition of multiphase flow where it is necessary to consider coupled processes on multiple scales as well as the interplay of a wide variety of relevant physical phenomena.

Computational & Experimental Methods in Multiphase & Complex Flow IX P. Vorobieff, C.A. Brebbia, 2017-10-11 The 9th book from this successful conference series on Computational Bubble and drop dynamics Interface behaviour Experimental measurements Energy applications Compressible flows Flow in porous media Turbulent flow Image processing Heat transfer Atomization Hydromagnetics Plasma Fluidised beds Cavitation Multiphase chemical reactions

Computational Methods in Multiphase Flow VI Andrea Alberto Mammoli, C. A. Brebbia, 2011 Multiphase flows which can involve compressible or incompressible linear or nonlinear fluids Are found in all areas of technology at all length scales and flow regimes In spite of their ubiquitousness however multiphase flow continues to be one of the most challenging areas of computational mechanics and experimental methods with numerous problems remaining unsolved to date Because the multiphase flow problems are so complex advanced computational and experimental methods are often required to solve the equations that describe them The many challenges include modelling nonlinear fluids modelling and tracking interfaces dealing with multiple length scales characterizing phase structures and treating drop breakup and coalescence Models must be validated which requires the use of expensive and difficult experimental techniques This book presents contributions on the latest research in these techniques presented at the sixth in a biennial series of conferences on the subject that began in 2001 Featured topics include Bubble and drop dynamics Flow in porous media Turbulent flow Multiphase flow simulation Image processing Heat transfer Interaction of gases liquids and solids Interface behaviour Small scale phenomena Atomization processes and Liquid film behaviour

Pref **Computational Methods and Experiments in Materials Characterization III** C. A. Brebbia, Andrea Alberto Mammoli, 2007 Until recently engineering materials could be characterized successfully using relatively simple testing procedures As materials technology advances interest is growing in materials possessing complex meso micro and nano structures which to a large extent determine their physical properties and behaviour The purposes of materials modelling are many optimization investigation of failure simulation of production processes to name but a few Modelling and characterisation are closely intertwined increasingly so as the complexity of the material increases Characterisation in essence is the connection between the abstract material model and the real world behaviour of the material in question Characterisation of complex materials therefore may require a combination of experimental techniques and computation This book publishes papers presented at the Third International Conference on Computational Methods and Experiments in

Material Characterisation Topics covered include Composites Ceramics Alloys Cements and Cement Based Materials Biomaterials Thin Films and Coatings Advanced Materials Imaging Analysis Thermal Analysis New Methods Surface Chemistry Nano Indentation Continuum Methods Particle Models Damage Mechanics Innovative Techniques Stochastic Methods **Advanced Computational Methods and Experiments in Heat Transfer X** Bengt Sundén, C. A.

Brebbia, 2008-06-19 In engineering design and development reliable and accurate computational methods are requested to replace or complement expensive and time consuming experimental trial and error work Tremendous advancements have been achieved during recent years due to improved numerical solutions of non linear partial differential equations and computer developments to achieve efficient and rapid calculations Nevertheless to further progress in computational methods will require developments in theoretical and predictive procedures both basic and innovative and in applied research Accurate experimental investigations are needed to validate the numerical calculations This book contains the edited versions of the papers presented at the Tenth International Conference on Advanced Computational Methods and Experimental Measurements in Heat Transfer and Mass Transfer held in Maribor Slovenia in July 2008 The objective of this conference series is to provide a forum for presentation and discussion of advanced topics new approaches and application of advanced computational methods and experimental measurements to heat and mass transfer problems The contributed papers are grouped in the following appropriate sections to provide better access for readers Natural and forced convection Heat exchangers Advances in computational methods Heat recovery Heat transfer Modelling and experiments
