bones are typical hard tissues in vertebrates. Due to hierarchical structural characteristics and excellent mechanical properties, hard tissues play important roles in the human body such as health protection, movement support, and food mastication. Once a hard tissue defect occurs, our living quality will be seriously affected. In general, hard tissues lack the ability to self-repair except for the regeneration ability of bone for small-scale defects. As a result, the past few decades have witnessed great progress in the field of biomaterials for hard tissue repair. Actually, both teeth and bone are masterpieces of biomineralization in nature; the repair and regeneration of hard tissues should be performed in a biomimetic way, either by using a biomimetic mineralization strategy or biomimetic materials.

Stem Cell Biology and Tissue Engineering in Dental Sciences Ajaykumar Vishwakarma, Paul Sharpe, Songtao Shi, Murugan Ramalingam, 2014-11-05. Stem Cell Biology and Tissue Engineering in Dental Sciences bridges the gap left by many tissue engineering and stem cell biology titles to highlight the significance of translational research in this field in the medical sciences. It compiles basic developmental biology with keen focus on cell and matrix biology, stem cells with relevance to tissue engineering, biomaterials including nanotechnology, and current applications in various disciplines of dental sciences, viz. periodontology, endodontics, oral craniofacial surgery, dental implantology, orthodontics, dentofacial orthopedics, organ engineering, and transplant medicine. In addition, it covers research ethics, laws, and industrial pitfalls that are of particular importance for the future production of tissue constructs. Tissue Engineering is an interdisciplinary field of biomedical research which combines life engineering and materials sciences to progress the maintenance, repair, and replacement of diseased and damaged tissues. This ever-emerging area of research applies an understanding of normal tissue physiology to develop novel biomaterial, acellular, and cell-based technologies for clinical and non-clinical applications. As evident in numerous medical disciplines, tissue engineering strategies are now being increasingly developed and evaluated as potential routine therapies for oral and craniofacial tissue repair and regeneration. Diligently covers all the aspects related to stem cell biology and tissue engineering in dental sciences: basic science research, clinical application, and commercialization. Provides detailed descriptions of new modern technologies, fabrication techniques employed in the fields of stem cells, biomaterials, and tissue engineering research, including details of latest advances in nanotechnology. Includes a description of stem cell biology with details focused on oral and craniofacial stem cells and their potential research application throughout medicine. Print book is available in black and white, and the ebook is in full color.
