Control of biofilms to control caries Jin Xiao, Xiaojing Huang, Mingyun Li, Richard L. Gregory, Keke Zhang, 2023-12-11 Dental caries a biofilm mediated multifactorial dynamic disease is identified as a type of global public health problem Microbes including commensals and opportunistic cariogenic pathogens such as Streptococcus mutants embedded within an extracellular matrix form a highly organized biofilm 3D structure Homeostasis of oral biofilm plays a vital role during caries development according to the ecological plaque hypothesis Under unfavorable conditions such as excessive sugar intake an excess of acid is produced by biofilm which resulted in an acid induced selection promoting the growth of acidogenic and aciduric microbes including opportunistic cariogenic bacteria The transition from eubiosis to imbalance finally promotes tooth hard tissue destruction

Thus controlling biofilms is key to controlling caries Though caries has been studied for decades the current situation of this disease is not optimistic From the perspective of biofilm firstly there is a lack of in depth analysis of pathogenic mechanisms Besides mature biofilms are mechanically hard to eliminate and much more resistant to antimicrobial agents than bacterioplankton Moreover materials that filling of decayed teeth are short of antimicrobial activity which contributes to secondary caries
