Bittner, 2013-10-16 The field of critical care medicine is evolving quickly To prepare for certification and refresh their knowledge today's practitioners need a concise multidisciplinary review that focuses on the core areas of critical care Ideal for critical care fellows critical care nurses residents and practitioners who spend time in the ICU This book employs brief chapters on focused topics to help readers review core areas and test their knowledge Features Broad scope addresses all major topics in adult critical care with contributions from experts in a range of disciplines Concise chapters based on commonly referenced topics make the review easy to navigate Focused discussions are based on patient presentation and are structured to include common causes initial management strategies pathophysiology differential diagnosis management and outcomes Incisive review questions 3-10 per topic include answers and explanations to help readers understand the how and why behind each answer Staff of MGH and its sister institutions provide consistent terminology and presentation throughout the review **To See or Not to See** Rani Toll, 2020-04-01 Background Assessment of the critically ill is traditionally based on vital signs blood pressure pulse respiratory rate temperature and level of consciousness Altered vital signs are however late indicators of deranged hemodynamics pointing to a need for additional more sensitive markers of circulatory compromise In the beginning of the 20th century the capillary refill CR time evolved as a possible non invasive adjunct to early prediction of the outcome in the critically ill The manoeuvre entails application of blanching pressure on the skin of the finger pulp or sternum for 5 seconds After release of the pressure the observer estimates time in seconds for the skin to return to original colour This time is hypothesized to reflect the dynamics of the microcirculation and its possible connection with hemodynamics In the 1980s the normal capillary refill time was set to 2 seconds and later extended to 3 seconds without a clear scientific foundation Naked eye estimations of CR time met increasing scepticism in the 1990s due to subjectivity and poor prognostic value for shock or death Several basic traits such as age and sex as well as ambient temperature were also shown to independently influence the CR time Various

methods have evolved with the capability to measure CR time quantitatively one of which is Polarisation Spectroscopy Imaging PSI PSI measures the Red Blood Cell RBC concentration in tissue e.g. the skin and can be used to measure CR time

Objectives The purpose of this study was to establish basic characteristics for quantified CR qCR identify possible influencing factors in healthy subjects and to investigate how this relates to current practice We also sought to identify technical demands for transfer of the technique into clinical studies In paper I we analysed the qCR time characteristics at 5 different skin sites forehead sternum volar forearm finger pulp and dorsum finger The objective of paper II was to investigate the inter and intra observer variability of naked eye CR assessments of different professions nurses doctors and secretaries representing laymen In paper III we observed the effect of low ambient temperature on the qCR time in different skin sites In paper IV we transferred the equipment from a laboratory to a clinical setting in the Emergency Department ED for application on potentially critically ill patients In this study we evaluated the most important factors determining a reliable data collection and influencing the amount of data possible to analyse

Methods qCR time was measured in a total of 38 volunteers and 10 patients in different skin sites 2-5 skin sites at different ambient temperatures PSI TiVi 600 and 700 WheelsBridge AB Linköping Sweden was used to determine the rapid temporal changes in RBC concentration in skin during the CR manoeuvre

Films using a range of the first measurements from paper I were shown for assessment to 48 observers working in the ED

Results In paper I we could delineate qCR curves and suggest 2 possible equivalents to the naked eye observed CR time which we named Time to Return to Baseline 1 tRtB1 and Time to Peak tPk We demonstrated differences in qCR curves depending on skin site and possibly due to skin temperature In paper II we showed a poor inter and intra observer reproducibility in visually estimating the CR time regardless of profession clinicians or laymen Paper III demonstrated a rapid effect of ambient temperature on qCR time in peripheral skin sites such as finger pulp The forehead regarded as a more central skin site was the most temperature stable site and showed least variability in qCR time as determined using tRtB1 Paper IV a study on patients in an ED setting yielded assayable data in 80% of the measurements We identified critical performance parameters to address in the further development of a more robust easy to use device for future validation of the possible relevance of qCR in patient triage and monitoring

Conclusions CR time can be quantified using PSI Quantified CR time demonstrated a large variability between different skin sites specifically skin temperature was shown to be an important factor influencing qCR time particularly at the fingertip Naked eye estimates of CR time were highly variable both within and between observers Agreement between quantified CR time and naked eye estimates was poor The prototypic PSI technique was feasible in a clinical setting and with further improvements clinical evaluation of qCR in relation to relevant patient outcomes will be possible
