Algebraic Aspects Of Cryptography Algorithms And Computation In Mathematics Volume 3:

Algebraic Aspects of Cryptography Neal Koblitz, 2012-12-06 This book is intended as a text for a course on cryptography with emphasis on algebraic methods It is written so as to be accessible to graduate or advanced undergraduate students as well as to scientists in other fields The first three chapters form a self contained introduction to basic concepts and techniques Here my approach is intuitive and informal For example the treatment of computational complexity in Chapter 2 while lacking formalistic rigor emphasizes the aspects of the subject that are most important in cryptography Chapters 4 6 and the Appendix contain material that for the most part has not previously appeared in textbook form A novel feature is the inclusion of three types of cryptography hidden monomial systems combinatorial algebraic systems and hyperelliptic systems that are at an early stage of development It is too soon to know which if any of these cryptosystems will ultimately be of practical use But in the rapidly growing field of cryptography it is worthwhile to continually explore new one way constructions coming from different areas of mathematics Perhaps some of the readers will contribute to the research that still needs to be done This book is designed not as a comprehensive reference work but rather as a selective textbook The many exercises with answers at the back of the book make it suitable for use in a math or computer science course or in a program of independent study

Topics in the Theory of Algebraic Function Fields Gabriel Daniel Villa Salvador, 2007-10-10 The fields of algebraic functions of one variable appear in several areas of mathematics complex analysis algebraic geometry and number theory This text adopts the latter perspective by applying an arithmetic algebraic viewpoint to the study of function fields as part of the algebraic theory of numbers The examination explains both the similarities and fundamental differences between function fields and number fields including many exercises and examples to enhance understanding and motivate further study The only prerequisites are a basic knowledge of field theory complex analysis and some commutative algebra The book

can serve as a text for a graduate course in number theory or an advanced graduate topics course Alternatively chapters 1-4 can serve as the base of an introductory undergraduate course for mathematics majors while chapters 5-9 can support a second course for advanced undergraduates Researchers interested in number theory field theory and their interactions will also find the work an excellent reference

Cryptographic Hardware and Embedded Systems - CHES 2002 Burton S. Jr. Kaliski, Cetin K. Koc, Christof Paar, 2003-08-02 These are the proceedings of CHES 2002 the Fourth Workshop on Cryptographic Hardware and Embedded Systems After the first two CHES Workshops held in Massachusetts and the third held in Europe this is the first Workshop on the West Coast of the United States There was a record number of submissions this year and in response the technical program was extended to 3 days As is evident by the papers in these proceedings there have been again many excellent submissions Selecting the papers for this year's CHES was not an easy task and we regret that we could not accept many contributions due to the limited availability of time There were 101 submissions this year of which 39 were selected for presentation We continue to observe a steady increase over previous years 42 submissions at CHES 99 51 at CHES 2000 and 66 at CHES 2001 We interpret this as a continuing need for a workshop series that combines theory and practice for integrating strong security features into modern communications and computer applications

In addition to the submitted contributions Jean Jacques Quisquater UCL Belgium Sanjay Sarma MIT USA and a panel of experts on hardware random number generation gave invited talks As in the previous years the focus of the Workshop is on all aspects of cryptographic hardware and embedded system security Of special interest were contributions that describe new methods for efficient hardware implementations and high speed software for embedded systems e.g. smart cards microprocessors DSPs etc CHES also continues to be an important forum for new theoretical and practical findings in the important and growing field of side channel attacks
