**The Interface Between Innate and Acquired Immunity** M.D. Cooper,H. Koprowski,2013-03-09 All multicellular organisms may possess innate immunity mediated by defense mechanisms with which the organism is born In recent years much has been learned about the diversity of innate immune mechanisms A large array of naturally produced antimicrobial peptides has been de fined A variety of cell surface receptors that recognize common patterns displayed by infectious organisms have been identified along with the intracellular pathways that these receptors use to activate cellular defense functions Cell surface receptors on natural killer NK cells have been shown to sense microbial invasion in neighboring cells thereby setting into motion their elimination by cy tototoxic mechanisms Other receptors have been found to facilitate phagocytosis and intracellular killing of microbes by phagocytic cells These and other natural defense mechanisms have traditionally been viewed as the first line of body defense in vertebrate species that also possess the capacity for acquired or adaptive immunity Sharks and all of the other jawed vertebrates generate large repertoires of T and B lymphocyte clones that display different antigen specific receptors in the form of T cell receptors TCR and immunoglobulins Ig that allow them to recognize and respond to antigens in collaboration with antigen present ing cells Memory T and B cells are then generated to allow faster and heightened cellular and humoral immune re sponses on secondary antigen encounter In recent years it has also become obvious that innate immune responses can directly influence adaptive immune responses in ways that will enhance body defense

decidual macrophages CD163 CD206 CD209 IL 10 CCL18 and the selective expansion of functionally suppressive CD25<sup>high</sup>Foxp3 Treg cells the latter partly mediated through IL 10 TGF and TRAIL The placenta also limited activation of Th cells for instance by generally reduced cytokine production Our data show that the placenta has a unique ability to induce tolerogenic immune cells with a reduced inflammatory potential which is essential for maintaining tissue integrity and preventing inflammation induced fetal loss

**Vascular Inflammation in Systemic Autoimmunity** Giuseppe A. Ramirez, Cornelia Weyand, Augusto Vaglio, Angelo A.

Manfredi, 2017-01-16 Plasticity and dynamism characterize the immune system as a tissue integrating network with defensive functions Blood and lymphatic vessel trees constitute the most evident and intuitive physical platform for the development of the net of interactions between immune cells body tissues and foreign agents Moreover vessel repair and immune patrolling are intimately linked physiological functions with common evolutionary roots Not surprisingly variable degrees of vascular inflammation are often detectable in the setting of systemic inflammation and autoimmunity whereas research in the field of cardiovascular pathology is progressively converging towards the identification of a common inflammatory background The definition of the role of vascular inflammation in causing sustaining and or predicting the development of systemic autoimmunity constitute a challenging unexplored frontier towards the development of a new generation of treatments and a better patient care
