A balance scale is the central visual element, running diagonally from the top left to the bottom right. It has three pans. The top-left pan is small and contains a landscape with a body of water and hills. The middle pan is larger and contains a dense forest. The bottom-right pan is the largest and contains a starry night sky. The scale is tilted, with the bottom-right pan being lower than the others.

***Progress in Ecological Stoichiometry*** Dedmer B. Van de Waal, James J. Elser, Adam C. Martiny, Robert W. Sterner, James B. Cotner, 2018 Ecological stoichiometry concerns the way that the elemental composition of organisms shapes their ecology It deals with the balance or imbalance of elemental ratios and how that affects organism growth nutrient cycling and the interactions with the biotic and abiotic worlds The elemental composition of organisms is a set of constraints through which all the Earth's biogeochemical cycles must pass All organisms consume nutrients and acquire compounds from the environment proportional to their needs Organismal elemental needs are determined in turn by the energy required to live and grow the physical and chemical constraints of their environment and their requirements for relatively large polymeric biomolecules such as RNA DNA lipids and proteins as well as for structural needs including stems bones shells etc These materials together constitute most of the biomass of living organisms Although there may be little variability in elemental ratios of many of these biomolecules changing the proportions of different biomolecules can have important effects on organismal elemental composition Consequently the variation in elemental composition both within and across organisms can be tremendous which has important implications for Earth's biogeochemical cycles It has been over a decade since the publication of Sterner and Elser's book *Ecological Stoichiometry* 2002 In the intervening years hundreds of papers on stoichiometric topics ranging from evolution and regulation of nutrient content in organisms to the role of stoichiometry in populations communities ecosystems and global biogeochemical dynamics have been published Here we present a collection of contributions from the broad scientific community to highlight recent insights in the field of Ecological Stoichiometry

*Phytoplankton Whispering: An Introduction to the Physiology and Ecology of Microalgae* Patricia M. Glibert, 2024-08-12 Phytoplankton or algae are the engines of the Earth They form the base of the aquatic food web and although microscopic they produce 50% of the oxygen in the air Many of our ideas of what makes these cells tick come from ideas developed decades ago But lakes and oceans are changing and so too are phytoplankton Our understanding has to change accordingly Nutrient pollution is a major problem worldwide and climate is changing altering temperature CO<sub>2</sub> and pH as well as the physics that control water stratification All of these factors control which species of phytoplankton may grow well at any particular time While algae grow in all types of aquatic systems not all algae are favorable for the production of fish and other food resources The prevalence of harmful algal blooms HABs has increased At the core of this effort is a drive to understand and to convey to researchers students and managers what kinds of phytoplankton are likely to thrive as conditions change and why this matters There has not yet been a synthetic summary that unravels the mysteries of phytoplankton in a modern world This book aims to provide such a resource

*Seeking Sustainability in an Age of Complexity* Graham Harris, 2007-06-14 Seeking Sustainability in an Age of Complexity explains the difficulties of sustainability and why collapse can occur In the last twenty years the theory of complexity has been developed complex systems science CSS speaks to natural systems and particularly to ecological social and economic systems and their interaction Due to the growing concern over the huge changes occurring in the global environment such as climate change deforestation habitat fragmentation and loss of biodiversity Graham Harris sets out what has been learned in an attempt to understand the implications of these changes and suggests ways to move forward This book discusses a number of emerging tools for the management of unruly complexity which facilitate stronger regional dialogues about knowledge and values which will be of interest to ecologists sociologists economists natural resource managers and scientists in State and local governments and those involved in water and landscape management

Mathematical Ecology of Populations and Ecosystems John Pastor,2011-08-31 MATHEMATICAL ECOLOGY Population ecologists study how births and deaths affect the dynamics of populations and communities while ecosystem ecologists study how species control the flux of energy and materials through food webs and ecosystems Although all these processes occur simultaneously in nature the mathematical frameworks bridging the two disciplines have developed independently Consequently this independent development of theory has impeded the cross fertilization of population and ecosystem ecology Using recent developments from dynamical systems theory this advanced undergraduate graduate level textbook shows how to bridge the two disciplines seamlessly The book shows how bifurcations between the solutions of models can help understand regime shifts in natural populations and ecosystems once thresholds in rates of births deaths consumption competition nutrient inputs and decay are crossed Mathematical Ecology is essential reading for students of ecology who have had a first course in calculus and linear algebra or students in mathematics wishing to learn how dynamical systems theory can be applied to ecological problems **Encyclopedia of Inland Waters** ,2009-01-13 Inland aquatic habitats occur world wide at all scales from marshes swamps and temporary puddles to ponds lakes and inland seas from streams and
