1. What are Tinbergen's 4 questions? Which deal with proximate explanations of behavior, and which deal with ultimate explanations? Can you explain the difference between a proximate and an ultimate question, or hypothesis? Could you give an example of each of Tinbergen's Four Questions? – The four questions are:

- What is the immediate causation of the behavior? (physical/physiological mechanisms)
- How does the behavior develop? (ontogeny)
- What is the evolutionary history of the behavior?
- What is the adaptive function of the behavior? Is the behavior adaptive?

The questions that deal with proximate explanations of behavior are immediate causation of behavior and how behavior develops. The questions that deal with ultimate explanations of behavior are evolutionary history of behavior and adaptive function of behavior. An example of a proximate (HOW) question would be how does behavior work and an example of an ultimate (WHY) question would be when and why did a behavior evolve and what is it good for.

2. What are the hypothesized benefits to a bird that can sing the local dialect? That is, why is song learning adaptive? – The hypothesized benefits to a bird that can sing the local dialect are that it attracts mates and repels rivals. Song learning is adaptive for males because they can use it to match with their social and physical environment. Song learning is adaptive for females because they can use learning quality as an indicator of developmental history and male quality.
3. What is the scientific method and how it is used to study behavior? What are the steps of the scientific method? What is the difference between a question, a hypothesis, and a prediction? – The scientific method is a scientific and quantitative way to study behavior and answer questions and within a scientific method, a hypothesis is made, and that hypothesis must be falsifiable with data, understanding depends on evidence. The steps of the scientific method are observation, question, hypothesis, prediction, test of prediction/experiment, and analyze results/conclusion. A question is just asking something to elicit information, a hypothesis can be tested, usually with an experiment or observation and a prediction is a statement, which tells or estimates something that will occur in future.
4. What is natural selection? Where/how did this idea originate? – Natural selection is an idea that was proposed by Charles Darwin that states organisms better adapted to their environment tend to survive and produce more offspring. It usually starts out on an individual level and is heritable. Because of it more offspring are produced that can survive because of the favorable variations and are passed down to their children. Natural selection is a passive filtering mechanism and is NOT good because it does not evolve for the species; natural selection ACTS on INDIVIDUALS rather than the group. Natural
