M13 4 Physi Sp3:

Physics and Chemistry of Finite Systems: From Clusters to Crystals Peru Jena, S.N. Khanna, B.K.N. Rao, 2013-11-11 Recent innovations in experimental techniques such as molecular and cluster beam epitaxy supersonic jet expansion matrix isolation and chemical synthesis are increasingly enabling researchers to produce materials by design and with atomic dimension. These materials constrained by size shape and symmetry range from clusters containing as few as two atoms to nanoscale materials consisting of thousands of atoms. They possess unique structural, electronic, magnetic and optical properties that depend strongly on their size and geometry. The availability of these materials raises many fundamental questions as well as technological possibilities. From the academic viewpoint the most pertinent question concerns the evolution of the atomic and electronic structure of the system as it grows from micro clusters to crystals. At what stage for example does the cluster look as if it is a fragment of the corresponding crystal? How do electrons forming bonds in micro clusters transform to bands in solids? How do the size dependent properties change from discrete quantum conditions as in clusters to boundary constrained bulk conditions as in nanoscale materials to bulk conditions insensitive to boundaries? How do the criteria of classification have to be changed as one goes from one size domain to another? Potential for high technological applications also seem to be endless. Clusters of otherwise non magnetic materials exhibit magnetic behavior when constrained by size shape and dimension. Nanoscale metal particles exhibit non linear optical properties and increased mechanical strength. Similarly materials made from nanoscale ceramic particles possess plastic behavior.

Physics and Chemistry of Finite Systems P. Jena, S. N. Khanna, B. K. Rao, 1992. Covers studies on a wide range of materials from clusters to nanostructures and quasicrystals, the emphasis being on understanding how the size dependent properties change from discrete quantum conditions as in nanoscale clusters to bulk conditions that are insensitive to boundaries.
