

Linear Programming problem

- This is an example of a **linear programming problem**. Every linear programming problem has two components:
- 1. A **linear objective function** is to be maximized or minimized. In our case the objective function is **Profit = $5x + 10y$** (5 dollars profit for each trick ski manufactured and \$10 for every slalom ski produced).
- 2. A **collection of linear inequalities that must be satisfied simultaneously**. These are called the **constraints** of the problem because these inequalities give limitations on the values of x and y . In our case, the linear inequalities
- are the **constraints**.

$$\text{Profit} = 5x + 10y$$

$$x \geq 0$$

x and y have to be positive

$$y \geq 0$$

$$x \leq 15$$

The number of trick skis must be less than or equal to 15

$$8x + 8y \leq 160$$

Design constraint: 8 hours to design each trick ski and 8 hours to design each slalom ski. Total design hours must be less than or equal to 160

$$4x + 12y \leq 180$$

Finishing constraint: Four hours for each trick ski and 12 hours for each slalom ski
