Staaden,2019-10-17 The rewarding properties of drugs depend on their capacity to activate appetitive motivational states Because the mechanisms underlying natural reward are an important life sustaining process and strongly conserved throughout metazoan evolution invertebrate models provide a powerful complement to the mammalian systems traditionally used in addiction research A wide range of organizational complexity combined with genetically manipulable and relatively simple accessible nervous systems make invertebrates excellent models in which to explore general addiction principles These include the role of natural reward systems in learning the basic biological mechanisms of drug addiction and the long term effects of early drug exposure The contributions to this e book illustrate the current state of invertebrate addiction research The chapters show that the reward circuits of invertebrate taxa are surprisingly sensitive to human drugs of abuse Employing learning paradigms typically used in vertebrate studies viz conditioned place preference and operant self administration paradigms invertebrates are shown to exhibit aspects of the addiction cycle from activational effects of common psychostimulants sensitization with repeated application to extinction withdrawal and reinstatement This highlights the value of the comparative approach for both exploring conserved mechanisms underlying drug addiction and the utility of invertebrate models in seeking potential solutions

Nuclear Regulatory Commission,1990 [Proteomics of Microbial Human Pathogens](#) Nelson C. Soares,Jonathan M.

Blackburn,German Bou,2017-01-17 According to the World Health Organization WHO in 2012 infectious diseases and related conditions account for more than 70% of premature deaths across 22 African countries and estimated 450 000 people worldwide developed multi drug resistant tuberculosis This alarming situation of great public health concern calls for the urgent development of novel and efficient responding strategies The employment of important research platforms such as

genomics and proteomics has contributed significant insight into the mechanisms underlying microbial infection and microbe host interaction. In this Frontiers Research Topic we aim to produce a timely and pertinent discussion regarding the current status of Proteomics of microbial Human pathogens and the role of proteomics in combating the challenges posed by microbial infection and indeed acquired anti microbial resistance. As the field of proteomics progressed from 2 DE gel based approaches to modern LC MS MS based workflows remarkable advances have been reported in terms of data quantity and quality. Given the immediate and enormous advantages that high resolution and accurate mass spectrometers have brought to the field proteomics has now evolved into a robust platform capable of generating large amounts of comprehensive data comparable to that reported previously in genomics studies. For example detection of the complete yeast proteome has been reported and other small proteomes such as those of bacteria are within reach. Mass spectrometry based proteomics has become an essential tool for biologists and biochemists and is now considered by many as an essential component of modern structural biology. Additionally the introduction of high resolution mass spectrometers has driven the development of various different strategies aimed at accurate quantification of absolute and relative amount of proteins of interest. Emerging targeted mass spectrometry methodologies such as Selected Reaction Monitoring SRM Parallel Reaction Monitoring PRM and SWATH are perhaps the latest breakthrough within the proteomics community. Indeed through a label free approach targeted mass spectrometry offers an unequalled capability to characterize and quantify a specific set of proteins reproducibly in any biological sample. Usefully Aebersold and colleagues have recently generated and validated a number of assays to quantify 97% of the 4 012 annotated Mycobacterium tuberculosis Mtb proteins by SRM. As such the Mtb Proteome library represents a valuable experimental resource that will undoubtedly bring new insight to the complex life cycle of Mtb. Finally as reviewed recently in Frontiers Research Topic mass spectrometry based proteomics has had a tremendous impact on our current understanding of post translational modification PTM in bacteria including the key role of PTMs during interaction of pathogenic bacteria and host interactions. We believe that our understanding of microbial Human pathogens has benefited enormously from both 2 DE gel and modern LC MS MS based proteomics. It is our wish to produce an integrated discussion surrounding this topic to highlight the existing synergy between these research fields. We envisage this Research Topic as a window to expert opinions and perspectives on the realistic practicalities of proteomics as an important tool to address healthcare problems caused by microbial pathogens.
