

51-70-10 REPAIR DESIGN GUIDELINE

1. General

A. Purpose of the Repair Design Guideline

Each repair on an aircraft structure has to be capable of sustaining the original justified design loads for static, fatigue and damage tolerance requirements. Only the static requirements will be considered in this chapter.

A static or stress analysis is performed to make sure that the structure can withstand the applied ultimate loads without failure and without permanent deformation at limit load.

There are two main approaches in demonstrating the static strength capability of the repair design. The approach taken depends on how much is known concerning the existing loading in the repaired part.

(1). All details of the applied loading are known:

In this case, a detailed stress analysis of the part to be repaired results in an optimized repair design. This is generally the approach taken by the manufacturer.

(2). No details of the applied loading are known:

In this case the REVERSE ENGINEERING METHOD may be employed to evaluate the repair static strength capability.

B. Scope and Limitations

This topic presents some guidelines which may be used when designing repairs for extruded/formed sections. These guidelines are based on the reverse engineering method.

As explained in Paragraph 1.D (Principle), these guidelines are based on the restoration of the static strength of the repaired part.

The resulting repair will therefore comply with the static strength requirements. These guidelines, when used together with the other standard SRM principles and guidelines (fastener hole and drill data, fastener pitch and edge distance data, sealing, etc.) may be used repairs to secondary structure without referring back to AIRBUS.

These guidelines may also be used when designing repairs, which are to be submitted to AIRBUS for approval, however it should be noted that the assumption taken when designing a repair based on the reverse engineering method are often conservative and may result in over-designed repairs.

The proposed method addresses only the static performance of the repair since no fatigue and damage tolerance assessment is required for repair solutions referring to this part. Nevertheless these repair solutions ensure minimum acceptable fatigue and damage tolerance performances.

List of Symbols

This list shows which symbols has been incorporated into the repair design guideline. It also shows the measurement unit of the used symbol and its description.

SYMBOL	UNIT	DESCRIPTION

orthopedic problems are diseases of the aged It is rather the result of uncertainty about the value of surgery in the elderly and concerns about the risks of operations In the past such concerns prevented primary care givers from referring patients for surgical care and prevented surgeons from agreeing to operate Resources in Vocational Education ,1977
