Minimization Methods for Non-Differentiable Functions N.Z. Shor, 2012-12-06 In recent years much attention has been given to the development of automatic systems of planning design and control in various branches of the national

economy Quality of decisions is an issue which has come to the forefront increasing the significance of optimization algorithms in mathematical software packages for automatic systems of various levels and purposes Methods for minimizing functions with discontinuous gradients are gaining in importance and the experts in the computational methods of mathematical programming tend to agree that progress in the development of algorithms for minimizing nonsmooth functions is the key to the construction of efficient techniques for solving large scale problems This monograph summarizes to a certain extent fifteen years of the author's work on developing generalized gradient methods for nonsmooth minimization This work started in the department of economic cybernetics of the Institute of Cybernetics of the Ukrainian Academy of Sciences under the supervision of V S Mikhalevich a member of the Ukrainian Academy of Sciences in connection with the need for solutions to important practical problems of optimal planning and design In Chap I we describe basic classes of nonsmooth functions that are differentiable almost everywhere and analyze various ways of defining generalized gradient sets In Chap 2 we study in detail various versions of the subgradient method show their relation to the methods of Fejer type approximations and briefly present the fundamentals of subgradient methods

Vector-valued Laplace Transforms and Cauchy Problems Wolfgang Arendt, Charles J.K. Batty, Frank Neubrander, 2013-11-11 Linear evolution equations in Banach spaces have seen important developments in the last two decades This is due to the many different applications in the theory of partial differential equations probability theory mathematical physics and other areas and also to the development of new techniques One important technique is given by the Laplace transform It played an important role in the early development of semigroup theory as can be seen in the pioneering monograph by Rille and Phillips HP57 But many new results and concepts have come from Laplace transform techniques in the last 15 years In contrast to the classical theory one particular feature of this method is that functions with values in a Banach space have to be considered The aim of this book is to present the theory of linear evolution equations in a systematic way by using the methods of vector valued Laplace transforms It is simple to describe the basic idea relating these two subjects Let A be a closed linear operator on a Banach

space X The Cauchy problem defined by A is the initial value problem $t \geq 0$ C^1 $u(t, x)$ where $x \in X$ is a given initial value If u is an exponentially bounded continuous function then we may consider the Laplace transform $\int_0^\infty e^{-st} u(t, x) dt$ of u for large real s

by Selberg *Introduction to the Spectral Theory of Polynomial Operator Pencils* A. S. Markus, 2012-09-14 This monograph contains an exposition of the foundations of the spectral theory of polynomial operator pencils acting in a Hilbert space. Spectral problems for polynomial pencils have attracted a steady interest in the last 35 years mainly because they arise naturally in such diverse areas of mathematical physics as differential equations and boundary value problems, controllable systems, the theory of oscillations and waves, elasticity theory and hydromechanics. In this book the author devotes most of his attention to the fundamental results of Keldysh on multiple completeness of the eigenvectors and associated vectors of a pencil and on the asymptotic behavior of its eigenvalues and generalizations of these results. The author also presents various theorems on spectral factorization of pencils which grew out of known results of M. G. Krein and Heinz Langer. A large portion of the book involves the theory of selfadjoint pencils, an area having numerous applications. Intended for mathematicians, researchers in mechanics and theoretical physicists interested in spectral theory and its applications, the book assumes a familiarity with the fundamentals of spectral theory of operators acting in a Hilbert space. **Nonlinear Hyperbolic Waves in Multidimensions** Phoolan Prasad, 2001-05-18 The propagation of curved nonlinear wavefronts and shock fronts are very complex phenomena. Since the 1993 publication of his work *Propagation of a Curved Shock and Nonlinear Ray Theory*, author Phoolan Prasad and his research group have made significant advances in the underlying theory of these phenomena. This volume presents their results and progress. **Quantum Legacy, A: Seminal Papers Of Julian Schwinger** Kimball A. Milton, 2000-05-25 Julian Schwinger 1918-1994 was one of the giants of 20th Century science. He contributed to a broad range of topics in theoretical physics ranging from classical electrodynamics to quantum mechanics, from nuclear physics through quantum electrodynamics to the general theory of quantum fields. Although his mathematical prowess was legendary, he was fundamentally a phenomenologist. He received many awards including the first Einstein Prize in 1951 and the Nobel Prize in 1965 which he shared with Richard Feynman and Sin-itiro Tomonaga for the self-consistent formulation of quantum electrodynamics into a practical theory. His more than 70 doctoral students have played a decisive role in the development of science in the second half of this century. This important volume includes many of Schwinger's most important papers on the above and other topics such as the theory of angular momentum and the theory of many-body systems. The papers collected here continue to underlie much of the work done by theoretical physicists today. **Computation of Nonlinear Structures** Debabrata Ray, 2015-12-14 Comprehensively introduces linear and nonlinear structural analysis through mesh generation, solid mechanics and a new numerical methodology called c-type finite element method. Takes a self-contained approach of including all the essential background materials such as differential geometry, mesh generation, tensor analysis with particular elaboration on rotation tensor, finite element methodology and numerical analysis for a thorough understanding of the topics. Presents for the first time in closed form the geometric stiffness, the mass, the gyroscopic damping and the centrifugal stiffness matrices for beams, plates and shells. Includes numerous examples and exercises. Presents solutions for
