Wireless technologies and applications are becoming one of the fastest growing and most promising areas in recent years. To accommodate data transmission by multiple stations sharing the scarce wireless bandwidth, a medium access control (MAC) protocol plays a crucial role in scheduling packet transmission fairly and efficiently. The emerging wireless networks such as ad hoc networks, sensor networks or mesh networks are mostly multi-hop based and in distributed manner which brings a lot of problems and challenges in designing fine-tuned MAC protocols tailored for modern wireless network. In this book, the authors give complete and in-depth overviews to the classic medium access control algorithms and the related protocols as well as their applications in various wireless data networks, especially the most successful Wireless Local Area Networks (WLAN). The book consists of three major parts. Part I of this book, including Chapters 1-7, is emphasising on the fundamentals of medium access control algorithms and protocols. Chapter 1 provides an introduction to the wireless networks such as overview of wireless networks, problems and challenges of the wireless networks and the classifications of MAC protocols as well as the performance metrics. Chapter 2 introduces important collision resolution algorithms applied in medium access controls, for example, the splitting algorithm and the backoff algorithm. Chapter 3 reviews the hybrid access control algorithms that combine both contention and allocation schemes. A series of important collision avoidance schemes are introduced in Chapters 4-7 respectively with a specific design goal covered in each chapter. Chapter 4 focuses on the multi-channel MAC protocols for collision avoidance. Chapter 5 introduces the concepts of power control and power management in medium access control and how they can be applied in MAC protocol design. Chapter 6 presents how to provide Quality of Service (QoS) to multimedia wireless networks in either centralised or distributed manner, and Chapter 7 explains how the smart antennas can be applied in the medium access control to provide high channel throughput and low packet collision. Multiobjective Optimization Methodology K.S. Tang, T.M. Chan, R.J. Yin, K.F. Man, 2018-09-03. The first book to focus on jumping genes outside bioscience and medicine. Multiobjective Optimization Methodology: A Jumping Gene Approach introduces jumping gene algorithms designed to supply adequate viable solutions to multiobjective problems quickly and with low computational cost. Better Convergence and a Wider Spread of Nondominated Solutions. The book begins with a thorough review of state-of-the-art multiobjective optimization techniques. For readers who may not be familiar with the bioscience behind the jumping gene, it then outlines the basic biological gene transposition process and explains the translation of the copy and paste and cut and paste operations into a computable language. To justify the scientific standing of the jumping genes algorithms, the book provides rigorous mathematical derivations of the jumping genes operations based on schema theory. It also discusses a number of convergence and diversity performance metrics for measuring the usefulness of the algorithms. Practical Applications of

Jumping Gene Algorithms Three practical engineering applications showcase the effectiveness of the jumping gene algorithms in terms of the crucial trade off between convergence and diversity The examples deal with the placement of radio to fiber repeaters in wireless local loop systems the management of resources in WCDMA systems and the placement of base stations in wireless local area networks Offering insight into multiobjective optimization the authors show how jumping gene algorithms are a useful addition to existing evolutionary algorithms particularly to obtain quick convergence solutions and solutions to outliers **Advanced Optical and Wireless Communications Systems** Ivan B.
