Plant Glycobiology - a sweet world of lectins, glycoproteins, glycolipids and glycans Els J. M. Van Damme, Nausicaä Lannoo,Cécile Albenne,Elisabeth Jamet,2015-02-12 Plants synthesize a wide variety of unique glycan structures which play essential roles during the life cycle of the plant Being omnipresent throughout the plant kingdom ranging from simple green algae to modern flowering plants glycans contribute to many diverse processes Glycans can function as structural components in the plant cell wall assist in the folding of nascent

proteins act as signaling molecules in plant defense responses or ER stress pathways or serve within the energy metabolism of a plant. In most cases, glycans are attached to other macromolecules to form so-called glycoconjugates, e.g. glycoproteins, proteoglycans, and glycolipids, but they can also be present as free entities residing in the plant cell. Next to the broad, complex set of glycans, plants also evolved an elaborate collection of lectins or proteins with a lectin-like domain which can recognize and bind to endogenous plants' own or exogenous foreign glycans. Though still poorly understood in plants, the dynamic interactions between lectins and carbohydrate structures are suggested to be involved in gene transcription, protein folding, protein transport, cell adhesion, signaling, as well as defense responses. As such a complex and largely undetermined glycan interactome is established inside plant cells between cells and their surrounding matrix inside the extracellular matrix and even between organisms. Studying the biological roles of plant glycans will enable us to better understand plant development and physiology in order to fully exploit plants for food feed and production of pharmaceutical proteins. In this Research Topic, we want to provide a platform for articles describing the latest research perspectives and methodologies related to the fascinating world of plant glycobiology with a focus on following subjects: 1. Identification and characterization of plant glycans, their biosynthetic and degradation enzymes; 2. Characterization of plant lectins and glycoproteins; 3. Plant glycans in the plant's energy metabolism; 4. Role of plant glycans in plant defense signaling; 5. Use of plant lectins in pest control; 6. Plant lectins as new tools in human medicine; 7. Glycoengineering in plants.

Spectral Line Shapes in Astrophysics and Related Topics Milan S. Dimitrijević, Luka Č. Popović, 2020-02-18. Spectral lines widths and shapes are powerful tools for emitting/absorbing gas diagnostics in different astrophysical objects from the solar system to the most distant objects in the universe, quasars. On the other hand, experimental and theoretical investigations of laboratory plasma have been applied in spectroscopic astrophysical research, especially in research on atomic data needed for line shape calculations. Data on spectral lines and their profiles are also important for diagnostics analysis and the modelling of fusion plasma, laser-produced plasma, laser design and development, and various plasmas in industry and technology like light sources based on plasmas or the welding and piercing of metals by laser-produced plasma. The papers from this book can be divided into four groups: 1. Stark broadening data for astrophysical and laboratory plasma investigations; 2. Applications of spectral lines for astrophysical and laboratory plasma research; 3. Spectral line phenomena in extragalactic objects; and 4. Laboratory astrophysics results for spectra investigation. The reviews and research papers representing new research on the topics presented in this book are of interest for specialists and PhD students. We hope that the present book will be useful and interesting for scientists interested in the investigation of spectral line shapes and will contribute to the education of young researchers and PhD students.
