International Plant Proteomics Organization (INPPO) World Congress 2014 Joshua L. Heazlewood, Jesús V. Jorrín-Novó, Ganesh Kumar Agrawal, Silvia Mazzuca, Sabine Lüthje, 2017-02-08 The field of proteomics has advanced considerably over the past two decades. The ability to delve deeper into an organism's proteome, identify an array of post-translational modifications, and profile differentially abundant proteins has greatly expanded the utilization of proteomics. Improvements to instrumentation in conjunction with the development of these reproducible workflows have driven the adoption and application of this technology by a wider research community. However, the full potential of proteomics is far from being fully exploited in plant biology, and its translational application needs to be further developed. In 2011, a group of plant proteomic researchers established the International Plant Proteomics Organization (INPPO) to advance the utilization of this technology in plants as well as to create a way for plant proteomics researchers to interact, collaborate, and exchange ideas. The INPPO conducted its inaugural world

congress in mid 2014 at the University of Hamburg Germany Plant proteomic researchers from around the world were in attendance and the event marked the maturation of this research community The Research Topic captures the opinions ideas and research discussed at the congress and encapsulates the approaches that were being applied in plant proteomics

Cell Signaling in Host-Pathogen Interactions: The Host Point of View Diana Bahia,Abhay Satoskar,Olivier Dussurget,2018-03-23 The ability of pathogens such as parasites bacteria fungi and viruses to invade persist and adapt in both invertebrate and vertebrate hosts is multifactorial and depends on both pathogen and host fitness Communication between a pathogen and its host relies on a wide and dynamic array of molecular interactions Through this constant communication most pathogens evolved to be relatively benign whereas killing of its host by a pathogen represents a failure to adapt Pathogens are lethal to their host when their interaction has not been long enough for adaptation Evolution has selected conserved immune receptors that recognize signature patterns of pathogens as non self elements and initiate host innate responses aimed at eradicating infection Conversely pathogens evolved mechanisms to evade immune recognition and subvert cytokine secretion in order to survive replicate and cause disease The cell signaling machinery is a critical component of the immune system that relays information from the receptors to the nucleus where transcription of key immune genes is activated Host cells have developed signal transduction systems to maintain homeostasis with pathogens Most cellular processes and cell signaling pathways are tightly regulated by protein phosphorylation in which protein kinases are key protagonists Pathogens have developed multiple mechanisms to subvert important signal transduction pathways such as the mitogen activated protein kinase MAPK and the nuclear factor kB NF kB pathways Pathogens also secrete effectors that manipulate actin cytoskeleton and its regulators hijack cell cycle machinery and alter vesicular trafficking This research topic focuses on the cellular signaling mechanisms that are essential for host immunity and their subversion by pathogens
