Van Regenmortel,2013-11-11 Virus Variability and Impact on Epidemiology and Control of Diseases E Kurstak and A Hossain I INTRODUCTION An important number of virus infections and their epidemic developments demonstrate that ineffec tiveness of prevention measures is often due to the mutation rate and variability of viruses Kurstak et al 1984 1987 The new human immunodeficiency retroviruses and old influenza viruses are only one among several examples of virus variation that prevent or make very difficult the production of reliable vaccines It could be stated that the most important factor limiting the effectiveness of vaccines against virus infections is apparently virus variation Not much is how ever known about the factors influencing and responsible for the dramatically diverse patterns of virus variability II MUTATION RATE AND VARIABILITY OF HUMAN AND ANIMAL VIRUSES Mutation is undoubtedly the primary source of variation and several reports in the literature suggest that extreme variability of some viruses may be a consequence of an unusually high mutation rate Holland et al 1982 Domingo et al 1985 Smith and Inglis 1987 The mutation rate of a virus is defined as the probability that during a single replication of the virus genome a particular nucleotide position is altered through substitution deletion insertion or recombination Different techniques have been utilized to measure virus mutation rates and these have been noted in the extent of application to different viruses The Veterinary Bulletin ,1986 **Cumulated Index Medicus** ,1994 **Current List of Medical Literature** ,1957 **Agrindex** ,1995 *Virus Variability, Epidemiology and Control* Edouard Kurstak,R.G. Marusyk,F.A. Murphy,M.H.V. Van Regenmortel,1990-09-30 Virus Variability and Impact on Epidemiology and Control of Diseases E Kurstak and A Hossain I INTRODUCTION An important number of virus infections and their epidemic developments demonstrate that ineffec tiveness of prevention measures is often due to the mutation rate and variability of viruses Kurstak et al 1984 1987 The new human

immunodeficiency retroviruses and old influenza viruses are only one among several examples of virus variation that prevent or make very difficult the production of reliable vaccines. It could be stated that the most important factor limiting the effectiveness of vaccines against virus infections is apparently virus variation. Not much is however known about the factors influencing and responsible for the dramatically diverse patterns of virus variability.

MUTATION RATE AND VARIABILITY OF HUMAN AND ANIMAL VIRUSES

Mutation is undoubtedly the primary source of variation and several reports in the literature suggest that extreme variability of some viruses may be a consequence of an unusually high mutation rate. Holland et al 1982, Domingo et al 1985, Smith and Inglis 1987. The mutation rate of a virus is defined as the probability that during a single replication of the virus genome a particular nucleotide position is altered through substitution, deletion, insertion or recombination. Different techniques have been utilized to measure virus mutation rates and these have been noted in the extent of application to different viruses.
