Arteriosclerosis Hypertension Chapters Pressure Classic:

Arteriosclerosis and Hypertension: With Chapters on Blood Pressure Louis Marshall Warfield, 2011-01-01 The aorta and its branches are highly elastic tubes having a smooth glistening inner surface When the arteries are cut open they present a yellowish appearance due to the large quantity of elastic tissue contained in the walls The elasticity is practically perfect being both longitudinal and transverse The essential portion of any blood vessel is the endothelial tube composed of flat cells cemented together by intercellular substance and having no stomata between the cells This tube is reinforced in different ways by connective tissue smooth muscle fibers and fibroelastic tissue Although the gradations from the larger to the smaller arteries and from these to the capillaries and veins are almost insensible yet particular arteries present structural characters sufficiently marked to admit of histological differentiation The whole vascular system including the heart has an endothelial lining which may constitute a distinct inner coat the tunica intima or may be without coverings as in the case of the capillaries The intima Fig 1 consists typically of endothelium reinforced by a variable amount of fibroelastic tissue in which the elastic fibers predominate The tunica media is composed of intermingled bundles of elastic tissue smooth muscle fibers and some fibrous tissue The adventitia or outer coat is exceedingly tough It is usually thinner than the media and is composed of fibroelastic tissue This division into three coats is however somewhat arbitrary as in the larger arteries particularly it is difficult to discover any distinct separation into layers

Arteriosclerosis and Hypertension Louis Marshall Warfield, 2015-07-12 Excerpt from Arteriosclerosis and Hypertension With Chapters on Blood Pressure Several years have elapsed since the appearance of the second edition of this book During this time there has been considerable experimentation and much writing on arteriosclerosis The total of all work has not been to add very much to our knowledge of the etiology of arterial degeneration Points of view and opinions change from time to time It is so with arteriosclerosis In this edition arteriosclerosis is not regarded as a disease with a definite etiologic factor Rather it is looked upon as a degenerative process affecting the arteries following a variety of causes more or less ill defined It is not considered a true disease Possibly syphilitic arteritis may be viewed as an entity the cause is known and the lesions are characteristic Much new material and many new figures have been added to this edition Some rearranging has been done The chapter on Blood Pressure has been much expanded and some original observations have been included The literature has been selected rather than indiscriminately quoted Much that is written on the subject is of little value It has always seemed to the author that there is not enough of the personal element in medical writings At the risk of being severely criticized he has attempted to make this book represent largely his own ideas only here and there quoting from the literature New chapters on Cardiac Irregularities Associated with Arteriosclerosis and Blood Pressure in Its Clinical Application have been added The fact that the book has passed through two editions is very gratifying and seems to show that it has met with favor The author takes this opportunity of thanking those who have loaned him illustrations Wherever figures are borrowed due credit is given

versatility ease of use and up to datedness **Arterial Hypertension** J. Rosenthal, 2012-12-06 It has been a little more than half a century since serious organized research on hypertension began Public and even physician interest in the subject remained minimal until the early forties and even then there were not more than a dozen fulltime investigators worldwide The first organization devoted to communicating regularly the results of hypertension research was created in Cleveland in 1945 it became the Council for High Blood Pressure Research of the American Heart Association in 1949 The early history of hypertension is not a story of progressive achievement Richard Bright is given great credit followed by Mahomed Allbutt Riva Rocci Bergman and Janeway but it was not until Volhard Fahr and Allen that some semblance of order emerged They were followed by a younger much more vigorous group of investigators who in fact initiated modern research in hypertension Two more generations have followed In the course of some fifty years we have seen emerge a magnificent body of evidence that has prescribed good treatment and contributed a considerable understanding of the many complex mechanisms involved in the hypertension Treatment is now actively promoted by public health agencies including the World Health Organization This is an other case of treatment preceding full understanding of the nature of the disease
